ADDRESS—20, TUDOR STREET, LONDON, E.C.

Riders' Competition Licences.

It is now generally known amongst readers that at present any motor cyclist competing in an open motor cycling event must be registered as a competition rider with the Auto Cycle Union, such registration being charged for, to unaffiliated riders at 5s., to members of affiliated clubs at 2s. 6d., and given gratis to individual members of the A.C.U. This rule is of great value as applied to ordinary events, but for some time we have been of the opinion that it needed revision as applied to sundry inter-club competitions. Convenient examples of the type of event upon which it pressed with undue weight were the Easter Monday Scarborough hill-climb and the Team Trials. Here we have a brace of sporting competitions, designed to promote intercourse between various affiliated clubs. The competition lends undoubted zest to the meet. Upwards of a hundred competitors may be expected to take part in such events annually. Of these hundred men probably not more than twenty-five will want to take part in any further open competition during the entire year. They may ride in local events, limited to members of their own clubs, but for those they will require no licence. But for such an inter-club event as the Team Trial or the Scarborough hill-climb, competition licences have been essential up till the week preceding the Team Trials, when a surprise announcement was made. The A.C.U. rule has hitherto been rigidly enforced for these events, and competitors have been reluctantly compelled to obtain licences. It was generally thought by representatives of the teams in the trials at Daventry on the 26th ult. that the A.C.U. would again insist upon each rider holding the half-crown licence, but, for the first time on record,

the various secretaries of clubs concerned were acquainted by wire a day or two before the event that each individual rider need not possess a licence, a special permit having been taken out by the M.C.C. for that particular competition. This was good news, as seventy-five half-crowns (approximately) would to all intents and purposes have been wasted. No doubt the A.C.U. was guided in its step by the attitude of the competitors and officials in the Scarborough hill-climb, and desired to avert any chance of a possible repetition. At any rate, we commend the A.C.U. on the wise move taken, and we feel convinced that the action will result in general good. This precedent we imagine the Union intends to imitate, and no doubt a clause will be embodied in the competition rules to cover future competitions of this nature, allowing any club which purposes holding an inter-club trial of the Team Trials type to apply to the A.C.U. for registration for that day only for all the riders engaged, either gratis or at a purely nominal lump fee. This will enable the A.C.U. to maintain clean sport without putting a lot of riders, who make a sole annual appearance in open competition, to unjustifiable expense. It must not be forgotten that in these inter-club events the riders have to bear heavy travelling expenses, and such rulings as competition licences must affect the entry list to a slight extent. We still await the A.C.U. official announcement on this matter, and club officials are sure to be eager to see it in order to grasp clearly the object and ideas of the ruling body. It is, however, obvious that any relaxation of the licence laws must not apply to the ordinary open classes in a club hill-climb, as the A.C.U. revenue would be reduced, and even now it is scarcely sufficient to meet the inevitable expenditure.

6867

Motor Cycle Racing at Brooklands.

THE first race meeting at Brooklands held on a day of the week other than Saturday took place last Wednesday, the 30th ult., and was a great success. The attendance was really excellent, the members' enclosures and the paddock being particularly well filled. There was only one motor cycle event (the City Motor Cycle Handicap), and this was well supported, since there were thirty-three entries.

The race was down on the programme as follows: Distance, about $8\frac{1}{2}$ miles, fork start. Cycles will pass the fork twice, and then enter the straight. The entrant of the winner to receive 25 sovs. or a cup at option, the entrant of the second 10 sovs. or a cup at option, and the entrant of the third to receive 5 sovs. or a cup at option. For all classes of motor bicycles

O. C. Godfrey ($3\frac{1}{2}$ h.p. Rex), 1m. 50s.; J. C. Smyth ($3\frac{1}{2}$ h.p. Rex), 1m. 50s.; H. G. Partridge (6 h.p. N.S.U.), 1m. 55s.; C. R. Collier ($3\frac{1}{2}$ h.p. Matchless), 2m.; L. M. Munro ($3\frac{1}{2}$ h.p. N.S.U.), 2m.; F. W. Applebee (5 h.p. Rex), 2m.; H. R. Abbott, jun. ($3\frac{1}{2}$ h.p. Triumph), 2m.; W. Dewar ($3\frac{1}{2}$ h.p. Triumph), 2m.; F. E. Barker ($3\frac{1}{2}$ h.p. Chater Lea), 2m. 55s.; R. J. Shanks ($2\frac{3}{4}$ h.p. Peugeot), 3m. 10s.; A. F. Rowell ($2\frac{3}{4}$ h.p. M. and M.), 3m. 30s.; W. Pollard (2 h.p. Minerva), 5m.

Another Runaway Win.

Seen from the members' bridge, the race was quite interesting.

Pollard led, followed by Shanks, Rowell, a huge batch (mostly indistinguishable), then Fenn, Toman, Wells and Evans, H. Collier, Bowen, and Martin. Bashall came next, but pulled up beyond the bridge with his belt off. Cook appeared to be travelling well. At the end of the first lap Pollard was still

The thirty competitors in the City Motor Cycle Handicap at Brooklands on Wednesday last lined up in the paddock. The spectators are watching the finish of the first race.

the cubic capacity of whose engines does not exceed 1,000 cubic centimetres. The following are the riders with their time allowances. W. E. Cook (7 h.p. N.L.G.), scratch; H. E. Parker (7 h.p. N.L.G.), 12s. start; H. V. Colver (8 h.p. Matchless), 12s.; F. W. Dayrell (8 h.p. J.A.P.), 25s.; H. H. Bowen (7 h.p. Bat), 25s.; W. H. Bashall (7 h.p. Bat), 25s.; H. A. Collier (8 h.p. Matchless), 25s.; H. Martin (8 h.p. N.S.U.), 30s.; F. Toman (5 h.p. Laurin-Klement), 40s.; W. H. Wells (5 h.p. Indian), 40s.; G. Lee Evans (5 h.p. Indian), 40s.; A. G. Fenn ($3\frac{1}{2}$ Triumph), 45s.; J. T. Bashall ($3\frac{1}{2}$ h.p. Triumph), 1m. 35s.; F. A. Applebee (5 h.p. Rex), 1m. 40s.; W. G. McMinnies ($3\frac{1}{2}$ h.p. Triumph), 1m. 40s.; J. F. Potts ($3\frac{1}{2}$ h.p. Triumph), 1m. 45s.; F. A. McNab ($3\frac{1}{2}$ h.p. Trump-J.A.P.), 1m. 45s.; F. W. Barnes ($3\frac{1}{2}$ h.p. Zenith-Gradua), 1m. 45s.;

leading, F. Applebee was drawing ahead, Barnes was going well, and Bowen appeared to be making the pace. It was then time to rush for the finish. This was by no means exciting, as the handicapping was by no means successful. H. Collier won by nearly a mile, while Partridge was second, and Colver was third. Cook made a close fourth, and then followed Dewar and McMinnies, followed by a rider whose number was illegible, Lee Evans, C. Collier, F. A. Applebee, Bowen, Fenn, Munro, Barnes, J. T. Bashall, F. W. Applebee, Dayrell, W. H. Bashall, Shanks, Godfrey, Pollard, Smyth, Martin, Parker, Potts, Toman (pedalling), and Wells. The starting price was five to one on the field, and the winner's speed was $69\frac{3}{4}$ miles an hour—the fastest yet accomplished in a motor cycle race on the Brooklands Track, or, in fact, on any other track so far as we are aware.

British Motor Cycle Racing Club.

THE Fourth Members' Meeting of the above club will take place at Brooklands on Wednesday next, 14th inst., at 3 p.m. Some good racing is anticipated, and it is hoped that motor cyclists and those interested in motor cycle racing will avail themselves of the entrance fee which allows

them in any part of the Brooklands motor course.

The Novices' Handicap is an event which will be of particular interest, and it is the wish of the management to encourage entries from members who are novices. The idea is certainly a good one, as it is

desirable to see how novices will perform in races when they are given the chance to compete. Two handsome cups have been given by Major Lloyd for this event.

Some improvement has been made with regard to number plates carried by the competitors. The new sample will be introduced on the machine which will be ridden by Mr. W. E. Cook. It consists of a circular plate 12 in. in diameter fixed to the rear wheel spindle, finished in black, and enabling the number to be painted on it in white.

The programme will consist of the following events:

1. **NOVICES' HANDICAP.**—Distance, three circuits, about 8½ miles (fork start). For all classes of motor bicycles, the cubic capacity of whose engines does not exceed 1,000 c.c. Open only to members who have never won a first prize in any motor cycle race that has been competed for on an enclosed track. Machines entered must be the *bona-fide* property of the riders. First prize, Brooklands silver cup, value £4; second prize, Brooklands silver cup, value £3; third, fourth, fifth, and sixth prizes. For the purpose of framing the handicap, the event will be run first as a timed race. Each member's performance will be noted, and the handicap based on the time occupied. Should a competitor improve his time by a margin exceeding 2½% of the preliminary run he shall be disqualified from taking a prize.

2. **THE T.T. HANDICAP.**—Distance, three circuits, about 8½ miles (fork start). For all classes of motor bicycles, the cubic capacity of whose engines does not exceed 750 c.c. First prize, £1 1s.; second prize, 12s. 6d.; third prize, 7s. 6d., or value.

3. **ALL COMERS' HANDICAP.**—Distance, three circuits, about 8½ miles (fork start). For all classes of motor bicycles, the cubic capacity of whose engines does not exceed 1,000 c.c., and not less than 450 c.c. First prize, £1 1s.; second prize, 12s. 6d.; third prize, 7s. 6d., or value.

4. **RECORD TIME TRIALS.**—Distances, one kilometre and one mile. Flying start. Open only to members who compete in one or more of events 1, 2, 3. Each member will be allowed one trial over the above-mentioned distances, and best performances will be noted for the undermentioned engine sizes: Class A, for engines not exceeding 275 c.c.; B, 350 c.c.; C, 500 c.c.; D, 750 c.c.; and E, 1,000 c.c. Certificates officially certifying the best performance made in each of the above classes will be given.

ENTRY FEES.—Event 1, 2s. 6d.; events 2 and 3, 2s. each event; event 4, 1s. each class. Entries close first post Friday, July 9th.

H. A. Collier (8 h.p. Matchless-Jap), who scored a runaway win at Brooklands last Wednesday. His average speed over the 8½ miles was 69½ miles per hour—the fastest accomplished in a motor cycle race to date.

BRADFORD M.C.C. OPEN HILL-CLIMB.

AS already announced, the Bradford Club will hold an open hill-climbing competition under the competition rules of the Auto Cycle Union at "the Steep," Denholme, on Saturday week, the 17th inst., to commence at 2 p.m. The classes are as follows:

Class 1.—For lightweight machines, not to exceed 112 lbs. in weight.

Class 2.—For single-cylinder motor cycles, not exceeding 85 mm. bore.

Class 3.—For machines with twin cylinders, not exceeding 71 mm. bore each cylinder, or multi-cylinders not to exceed 55 mm. bore each cylinder.

Class 4.—Variable gear class, for single cylinders, not exceeding 85 mm. bore.

Class 5.—Variable gear class for twins, not exceeding 76 mm. bore each cylinder, and for multi-cylinders 55 mm. bore each cylinder.

Class 6.—For single-cylinder racing machines, not exceeding 85 mm. bore.

Class 7.—For twin-cylinder racing machines, not exceeding 75 mm. bore each cylinder, and 55 mm. bore for multi-cylinders.

Class 8.—Open to any motor bicycle, size of engine and weight of machine unlimited.

THE AWARDS.

A trophy in the form of a silver cup, to be won outright by the rider making the fastest ascent of the day. Gold medals will be awarded to each class winner with the exception of the winner of the fastest time trophy.

Silver and bronze medals will be awarded to the second and third in any class having not less than ten entries.

A pair of tyres to the value of £6 10s. will be awarded to the amateur making the fastest time, unless he should be the winner of the silver cup, in which case the tyres will go to the second best amateur performance on time.

A motor cycle acetylene lamp will be awarded to the amateur making the next best performance on time.

The above prizes will be awarded purely on time results.

Every machine entered in Classes 1, 2, 3, 4, and 5 must be in full touring trim, fitted with horn, toolbag, tools, efficient metal mudguards, and silencer, and be absolutely standard in every respect. Tourist Trophy models must enter the racing classes. A committee of scrutineers will inspect and classify the machines before the commencement of the event.

Entries and fees must be in the hands of the trials hon. secretary, F. Scriven, Alma House, Bradford, on or before the 14th inst.

THE HEAVYWEIGHT MOTOR CYCLIST RECORD BEATEN.

AFTER Mr. J. H. Davis's photograph appeared in *The Motor Cycle* of the 16th ult., we imagined that his "record" of 18 stones 11 lbs. would stand. We now publish a photograph of Mr. W. F. Cross, of Sunderland, who is a keen

Does Mr. W. F. Cross hold the heavyweight motor cyclist record? He scales 19 stones 12 lbs., and is 6ft. 1in. high.

supporter and worker for the Sunderland and District M.C.C., and rides a $3\frac{1}{2}$ h.p. Minerva motor bicycle. His height is 6ft. 1in., and his weight as he appears in the photograph 19 stones 12 lbs.—15 lbs. heavier than Mr. Davis.

He has taken part in several of the above club's competitions, won medals in hill-climbing and speed judging contests, and has on many occasions ridden 150 miles a day. He has climbed the famous Ragpath Hill, Durham, with pedal assistance, the gradient near the top approaching 1 in 5. These performances speak volumes for his $3\frac{1}{2}$ h.p. single-gear machine in the hilly north country.

The machine has no free engine clutch. Mr. Cross runs alongside, switches on, and jumps into the saddle as nimbly as many riders half his weight and thirty years his junior.

Mr. J. B. Dall, Commercial Road, Ladybank, Fife, has introduced an improved detachable belt fastener. In the case of the new pattern the inner flanges are roughened to ensure a better grip of the belt. The Dall belt fastener is not only detachable, but variable in length to suit adjustable pulleys. Competitors in the Scottish Reliability Trials for motor cycles (July 19th to 23rd) can have one of these fasteners free of charge on sending size required and name of belt to the above address.

A NOVEL PETROL FUNNEL.

A PETROL funnel which Messrs. Brown Bros., Ltd., Great Eastern Street, E.C., are selling under the name of the "No Shamy" funnel is specially designed for intercepting the least particle of water or dirt which may be contained in the petrol. The title "No Shamy" is an American one, and means "No Chamois." American motorists are accustomed to use a piece of chamois skin to filter petrol. owing to much of the petrol sold in the States containing a large percentage of dirt which would be likely to obstruct the orifice in the jet tube. There are times when spirit used in this country also requires careful filtering, and this applies more to small quantities bought haphazard, the sealed tins being usually free from any impurities. To make use of the funnel, the petrol should be poured into the large pocket shown by the cutaway portions in the illustration. After pouring, the funnel should be tipped to one side, so that the petrol left at the bottom can run through the gauzes. Water cannot be carried with the petrol through the gauzes, and all water and impurities will be found to be left in the large pocket of the funnel. The over-all dimensions of the motor cycle size are $4\frac{3}{4}$ in. long by $2\frac{3}{4}$ in. deep by $1\frac{1}{2}$ in. wide. It will be seen, therefore, that it is possible to carry the funnel in a toolbag. We have used one regularly for some weeks, and have never experienced a choked carburetter since.

Messrs. F. Reddaway and Co., of Pendleton, Manchester, makers of the Camel tyres and belts, have opened new premises at 212, Shaftesbury Avenue, London, opposite the Daimler depot.

Mr. V. A. Holroyd, one of the judges in the M.C.C. Team Trials at Daventry, patrolling the main London road, on his four-cylinder F.N. Writing of heavyweights reminds us that Mr. Holroyd weighs over 17 stones.

Where Improvement is Needed.

By W. G. McMINNIES.

IN reading accounts of trial runs on motor cycles and cars it always strikes me as curious that most writers, whilst praising various good features of the machines, generally fail to point out their particular faults, and hardly ever make any reference to points which might be improved. This seems to me a pity, for, since certain good points are common to most machines, it is a waste of time to enumerate them. It would be a much better plan if the writer when referring to a motor's behaviour would mention its particular drawbacks as well as its specially good features. This method of criticism would benefit not only the public, but the manufacturer also, who would probably remedy and improve the defects which the motor expert had drawn attention to.

Although I do not propose to point out the faults of the motor cycles of to-day, I think a few words about possible improvements would be of interest to readers of *The Motor Cycle*. It was evident at the last Stanley Show that the majority of machines have settled down to standard lines. But if the ordinary man in the street is going to take up motor cycling he must have a comfortable, clean, simple, and safe machine to handle.

More Efficient Mudguards Needed.

Now that effective non-skid tyres for motor cycles are obtainable there are many more all-weather riders than there used to be; consequently all last winter there was a cry for more efficient mudguarding. The disgusting state which machine and rider appeared in after 150 miles of mud-plugging was more than enough to frighten away many would-be motor cyclists. Of course, there are several kinds of mud screens on the market, but these should be sold as standard equipment, and not as extras. Undoubtedly they rather spoil the appearance of a graceful machine, but, on the other hand, what machine looks nice when smothered in mud? Some up-to-date maker might bring out a mudguard designed like motor car guards and fixed to the frame of the machine. Instead of moving with the front wheel, it would be stationary. It would be about one foot broad, and have its edges turned down. The two mudguards would extend well round the wheels, and would be connected by a running footboard just as on a car. Sufficient width would be allowed the front guard to prevent the wheel bespattering the machine with mud when turning a corner.

The belt might cause some trouble, but let us hope with "Ixion" that it will die a natural death and give place to a worm or bevel drive. The belt certainly bespatters both machine and rider with mud when the roads are bad, and, this being the case, it seems strange why so few manufacturers fit belt guards over the rear wheel.

Two Speeds Desirable.

The gear drive should be combined with a two-speed gear, thus doing away with pedalling gear, which causes so much trouble in wet weather, owing to the seizing of the free-wheel clutch. There is no doubt whatever that many people do not take up motor cycling simply from the fear of starting a machine, which seems to them to require far too much physical exertion. The obvious advantages of a two-speed

gear and free engine clutch have been so well threshed out in these columns that there is no need to repeat them, whilst every *bonâ fide* all-weather rider knows by experience that the variable gear is bound to come if the motor cycle is to thrive and prosper.

The Lubrication System Criticised.

My next grumble is regarding the system of lubrication adopted on most motor cycles. This is rough and ready to a degree, and its sole advantage is its simplicity. How is it that motor cars can run 10,000 miles without having their pistons and cylinders taken off and scraped? How is it that a certain well-known car went through the 2,000 Miles Trials last year and only consumed a gallon of oil? Some motor cycle engines, especially those with high compressions, have to be taken down and cleaned every 800 miles.

F. G. Smith (1909 Triumph) who has been awarded the M.C.C. Challenge Cup for adhering closest to the time schedule in the M.C.C. London to Edinburgh and Back Runs.

others may last for 1,800; but I have never heard of an engine running for 10,000 miles without such attention. A certain trade rider in the 1,000 mile trials of 1907 told me that he was only using half a pumpful of oil every twenty miles, whilst others were consuming a pumpful every ten miles. The makers have no mercy on the unfortunate amateur who attempts economy in this direction. Any faulty running is at once attributed to under-lubrication, so the owner promptly uses more oil, and knocking soon sets in. Too much oil, causing preignition, is the maker's retort this time. The tyro must have the lubrication done for him. There must be a pump maintaining a constant level of oil in the crank case, so that an overflow will draw back into a sump and be used again. The faster it runs the more oil will the pump deliver to the bearings and *vice versa*, which is exactly what is needed.

Oiltight Crank Cases the Exception.

Again, how seldom one sees a really oiltight crank case. Oil oozes out of bearings, tappet guides, and timing gears, and in a short time dust and mud have completed the work of making the engine filthy to handle. Some of the highest grade machines suffer

Where Improvement is Needed.—

From this complaint. When we get our mudproof machine and oiltight crank cases, adjustments will be a pleasure to perform, and we shall not have to complete every operation by a wash at the petrol tap. Several prominent motor manufacturers have enclosed their valve gear, and perhaps this method will help us in solving the difficulty.

Nowadays, practically the only reason for dismantling the cylinder is to scrape away the burnt oil and clean it out, so that if the old Buchet type of combustion chamber came into fashion again, and we could remove the cylinder head by undoing four holding-down bolts, we should save a lot of time over the present method. The difficulty of keeping the joint gastight is surely not insurmountable. It would also be convenient for competition work to have a couple of combustion heads giving different compression spaces—one for touring and another for hill-climbs and speed work.

Lightness and Simplicity.

The lightweight is the machine of the future, and will be a serious competitor to the bicycle when prices have come down a bit. Those makers who now only make heavy machines would do well to get under way with a lightweight model. Personally, I should like a miniature edition of the present-day single-cylinder machine, which should weigh about 90 lbs. and be of $\frac{3}{4}$ h.p. As regards simplicity, automatic lubrication, carburation, and fixed ignition would make matters simple enough for the novice, who would thus have the throttle alone to manipulate. So few carburetters

are easily understood, upon first acquaintance with them, that it is the simplest thing in the world to muddle the mixture and fail to climb a steep hill successfully. Generally speaking, automatic carburetters are not a success on motor cycles owing to the enormous flexibility of the engines, which run at all speeds up to 3,000 r.p.m. Air supply and engine revolutions go hand-in-hand, with the exception that in summer slightly more air is needed than in winter. It might be possible to fit a governor on the extra air valve, so that at slow speeds this would remain shut, but at high speeds it would open, and thus the faster the engine ran the further the governor would open the extra air inlet. Probably this device has already been tried and found wanting. It is the custom with many motor cyclists, when descending a hill, to close the throttle and open the extra air. The result of this is, in most cases, to suck up oil into the combustion chamber and foul the piston. How is it that the air brake is not more popular, by which, when the throttle is closed, a further movement of the lever admits pure air into the cylinder? Naturally the air valve in this case is on the engine side of the throttle. This device is very useful for scavenging and cooling the cylinders, besides acting as a brake. Another improvement which might be embodied in many carburetters is a device for varying the amount of air opening to the choke tube, thus allowing of a richer mixture and slower running. It could easily be arranged for a further movement of the lever, after closing the extra air inlet, to shut off the main air below the jet.

THE A.S.L. SPRING-FRAME MOTOR BICYCLE.

A NOVEL spring frame motor bicycle is the twin-cylinder A.S.L. illustrated herewith. Two of these machines were ridden by competitors in the London-Edinburgh run, and were much admired. One of the machines had 22in. wheels, which proves to what extent vibration is reduced, as it would be very uncomfortable to ride a rigid framed machine with 22in. wheels 400 miles in twenty-two hours. Air springs are used on the A.S.L. The elasticity of steel is confined to very narrow limits, while the elasticity of air is unlimited. The air spring consists essentially of a hollow pressed steel cylinder and plunger filled with compressed air. The stroke of the plunger is 2in., and the movement can be varied for riders of different weights by pumping air through a valve, using an ordinary tyre pump. The cushions are claimed to be absolutely airtight, the packing between the cylinder and plunger being a rolling "mitten," which performs its function without friction. It must be admitted that the air springs are not at all unsightly, and if all the claims made for them can be substantiated in practice, we can predict a big future for them on motor cycles. We are favourably inclined towards spring frame motor bicycles, realising that any device which can improve the comfort in riding, especially

on uneven surfaces, will be welcomed by motor cyclists in general. We have not tried the A.S.L. air springs on a motor bicycle as yet, but the makers' representative kindly loaned us a push bicycle to gain an idea

A twin-cylinder motor bicycle, the rider of which is insulated from road shocks by means of air springs.

of the comfort of being suspended on air. We must say that the springs entirely insulate the rider from road shocks, the unfair test of riding the bicycle over a brick resulting in no more perceptible jar than in the case of riding over a stone with a rigid framed bicycle. Shortly we may be carrying out further tests with these air springs applied to a motor bicycle, and will refer to them again in these columns.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, 'The Motor Cycle,' 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Sluggish Starting.

?

Please tell me how to rectify the trouble I have in starting my 3½-4 h.p. motor cycle (Stevens engine). It always takes me at least ten minutes running before I can get the engine to fire, and I generally have to start it running down hill because the pulley is so stiff. It is always well lubricated, and I inject petrol, and have tried it with the compression tap slightly open, but to no effect. Once started, however, I have no further trouble until the engine has cooled a little, and then I again have the same bother. It is so stiff that the pedal will bear my whole weight with the exhaust valve lifted. —S V.

If you inject a little paraffin into the compression tap instead of petrol we think the trouble will cease. The easiest method of starting a motor cycle is to inject paraffin and then run the engine on the stand. If you have no pedals this cannot very well be done. Does the machine run satisfactorily when it actually is going, and when warm is it really free? If not have it taken down and have the bearings examined. It seems as though something is binding. The perfect adjustment of the carburetter is everything if you wish to obtain easy starting. If the main air intake is too large, easy starting will never be possible.

J. V. Robinson (2½ h.p. Twin Douglas) a competitor in this week's Reliability Trials. This rider won a silver medal in the London-Plymouth and Back Run as well as gold medals in the London-Edinburgh Run, M.C.C. Hill-climb, and a non-stop certificate in the last Quarterly Trial.

Fitting a Free Engine Clutch.

?

I do not at all like running alongside my machine and then stepping on to the pedal when the engine fires, so I am contemplating fitting a Mabon free engine clutch. I have never seen the fitting in question, but it has occurred to me that there may be some difficulty in starting a magneto-ignited engine by means of a handle connected direct to the crankshaft. I am unable to make any experiments in this direction, as I am at present serving abroad, and shall not be returning to England for a few months. The question, therefore, which I desire to settle is this: Would handle starting be reasonably easy under the circumstances, and how many turns of the handle would probably be required to start the engine?—B. A. S.

It is difficult to start a magneto-ignited machine by means of a handle on the crankshaft. It is far better to start the machine by means of the pedals when jacked up on the stand, place the clutch in the free engine position, put down the stand, then sit astride the machine, and gently engage the clutch.

Carburetter Adjustment.

?

I recently purchased a 5 h.p. twin Peugeot, 1908 pattern. My difficulty seems to be exactly the same as that of "C 91," who wrote in a recent issue of *The Motor Cycle*: "I cannot get the machine to run at all slowly, it is a case of about 30 m.p.h. or nothing." This is not an exaggeration, as I tested it by a speedometer. When I first bought the machine it always took full air, and would even start with extra air fully open. I therefore had two holes drilled in the inlet pipe (the holes are about ¼ in. by ¼ in.), and now it runs best with these open and about half extra air, the throttle being half open, spark fully retarded. Advancing the spark accelerates the machine a little, but there is a good deal of misfiring unless the spark is perfectly adjusted. When I mount the machine I start with throttle fully open. I then set air as described, but it does not run at its best till the throttle is slightly closed. Any shutting off of air

causes missing; giving more air produces a dead stop. Originally (i.e., before drilling holes in inlet) it would only run with throttle fully open, now it runs as well with it half shut, but the speed is just the same. Ignition is by two trembler coils and make and break. I have adjusted contacts, etc., very carefully, and it will start in five yards. Besides not being able to run slowly, I am troubled with occasional missing, even when all levers are set very carefully. Any alteration is liable to produce worse missing. Nevertheless, it runs at a very high speed when throttle is fully open, and will usually simply fly up a stiff hill.—L. OWEN.

You might try another make of carburetter with handle-bar control. Your trouble appears to be due to imperfect adjustment of carburetter, or the carburetter is incapable of giving a rich enough mixture at slow engine speed when throttle is nearly closed. Boring the holes in the inlet pipe was, we think, a mistake under the circumstances; the main air openings are probably too large, or the space around the jet is too large for slow engine speed. Also test the level of the petrol. It should rise to within ¼ in. of the top of jet orifice. It is probable that the inlet springs are too strong. If you want to retain the original carburetter you could try a smaller jet and adapter, and purchase a handle-bar control device which will fit.

The only 1909 3½ h.p. Excelsior in the Six Days' Trials is being ridden by H. Berwick, who is seen in the above illustration. We have recently tested one of these models, and shall relate our experiences in an early issue.

Adjustment of Coll. Variable Pulleys.

[?] (1.) Kindly inform me as to the correct adjustment of a trembler coil. Should one try to get as high a note as possible? (2.) Are the automatically variable pulleys as made by the Lloyd Engineering Co. really good? Would you think that one of these would be a success fitted to a 2½ h.p. Bradbury?—J.L.T.

(1.) One should try and get a fairly high note and avoid having the points closer than is absolutely necessary. The quicker the vibrations the less current will be consumed. (2.) We have tried the variable pulley referred to in your query. It is quite satisfactory, and would be likely to suit your machine.

Paraffin as a fuel.

[?] (1.) Will you kindly tell me if I can run my engine on paraffin (White Rose) by having a small tank for petrol on the top bar above the ordinary tank, with tap and connections to carburetter? I thought of starting up on petrol until the engine got warmed, when the petrol tap could be turned off and the one for paraffin opened. I should, of course, fit levers to operate the taps, to avoid dismounting. (2.) Does paraffin deposit carbon more rapidly than the lighter fuel? (3.) Should I get as much power? (4.) Would any alterations in the carburetter jet or choke tube be necessary?—S. HUGH, Penzance.

(1.) Your engine would run on paraffin after it has become warm, but (2) a good deal of deposit would be found on the cylinder, and you might have trouble from pre-ignition eventually. (3.) You would probably get as much power at first. (4.) With some carburetters no alteration is necessary. Taking all things into consideration, we do not recommend paraffin except for cleansing purposes. In our opinion, there is not sufficient difference in the cost of the two fuels to warrant the alterations on a motor bicycle which runs a hundred miles to a gallon of petrol. Paraffin is a very objectionable liquid. It collects dust to a great extent, it reeks, and any machine with a paraffin tank and taps on it always looks messy.

H. Bevir, of Oxford, an amateur who is riding a 3½ h.p. L.M.C. in this week's trials.

Lack of Power. Route Wanted.

[?] (1.) When last out with my 5 h.p. twin-cylinder machine it went fairly well on the level, but would not take the slightest hill. Can you please suggest to me the probable cause of loss of power? (2.) I intend going by boat to Ilfracombe, and thence by road to Looe, in Cornwall. Kindly tell me the best and most direct route for motor cycling from Ilfracombe to Looe.—R.G.T. (South Wales).

(1.) It is difficult for us to say what is the matter with your machine with-

A. G. Fenn, one of the trials competitors, who is riding a Twin-cylinder Bat-Jap.

out examining it. Test the compression, and if this is poor try grinding in the valves, and if this does not bring about the desired result fit new piston rings. See that the carburetter and feed pipe are clear, and that the ignition is in good order; also pay attention to the strength of the valve springs. (2.) Your best route would be as follows: Ilfracombe, Ashford, Barnstaple, Westleigh, Bideford, Monkleigh, Holsworthy, Launceston, Liskeard, Looe.

Engine Fails on Hills.

[?] When climbing even a moderately long hill on practically full throttle, no extra air, spark fully advanced, the explosions when nearing the top become stifled and finally cease. A rest of even half a minute is generally sufficient to enable engine to recover. My machine is one of the old 2½ h.p. Minervas, inclined engine, on a B. and K. frame. Carburetter, Minerva Longuemare; magneto, Eise-man; timing, in order; exhaust valve lifts as soon as tappet starts lifting. I cannot give any extra air even with full throttle, which is curious, as the symptoms seem to me to point to overheating. I have just had cylinder down and cleaned out thoroughly without any improvement.—W. H.

The case seems to be purely one of overheating. We take it that you gradually retard the spark as the engine slows down. We suggest that you try a different brand of oil and lubricate fairly frequently, also take down the silencer and clean it. You do not mention the amount of lift of the exhaust valve. With old engines the valve cams are usually found to be worn, which considerably affects speed and power on hills.

READERS' REPLIES.

Gear Drive.

In answer to query from 1585, I, too, am a user of the F.N. four-cylinder machine—a finer machine I never rode. I also noticed the same rattling noise as your correspondent mentions. Let him see that the gear cases are well filled with graphite grease. Then fit a set of Bosch plugs and sit back and hold tight. He will have no more trouble with noisy gear wheels.—F.N. 1559.

A reader complains about the noise from his bevel drive. The chattering he complains of is caused from the following: (1.) One of the cylinders missing. Remedy, feel exhaust pipes, the coldest being the missing one. See to plug, or exhaust cotter may be broken. (2.) The cone of back wheel may be loose, and on tightening up the noise will cease. I have just seen a new machine chattering from a loose cone. I am not troubled from this noise, and when I hear the slightest I open the throttle. It may interest riders to know I lubricate my 5-6 h.p. F.N. with Butterworth's "M," one pumpful every five or six miles. The oil is very thin, and does not stop up plugs when past the rings. I have also drilled out my silencer with twenty ¼ in. holes in the inner pipe, and have increased my power greatly, without any more noise.—ERNEST S. DANGER.

Better Compression when Engine Turned Backwards.

Re the query in *The Motor Cycle* about an engine having better compression when turned backwards. I recently had a 2¾ h.p. engine with the same trouble, and traced the cause to the exhaust cam slightly lifting valve dead on compression stroke, although when the cam had just finished lifting valve on exhaust stroke there was a good 1/16 in. clearance. This, I think, would explain the cause of better compression backwards, as the cam would be in a different position. This may also explain "H. A. B.'s" trouble, "irregular compression," for if there is any lateral play in cam and the cam worn on one side more than another, it would cause the valve to lift sometimes and be all right at other times.—F. PIKE.

RELIABLE ACCESSORIES AT
London's Lowest Prices

THE NORTH ROAD DUST AND RAINPROOF OVERALLS.

These meet a long-felt want; they can be instantly slipped on over the ordinary trousers, they fasten round waist with a leather strap and buckle. Being made in one piece they are a great protection to the stomach, also it is impossible for the rain to drive in as

with the ordinary overalls. Made in three lengths—short, medium, and long. Shaped to go over boot. Patent Side fasteners. Price, in fawn waterproof material, 16s. 6d. Postage 6d.

THE "ACME" WATCH HOLDER.

Will not rust. Made in aluminium. Will fit all handle-bars. Complete with Ingersol watch that is specially constructed to stand vibration. Watch can be set and wound without removing same from case. Each watch has a written guarantee given with it for 12 months. Price, complete, 8/6. Case only, 3/6. Post free.

THE LODGE PLUG.

Suitable for magneto or accumulator ignition. Spark brought well away from all cold metal surfaces, enabling maximum power to be obtained from spark and extremely weak mixtures to be fired. Three spark points and centre rod all of absolutely pure nickel and substantial in size. The spark will not burn them away. Porcelain sleeve round central electrode, which keeps hot enough to prevent the deposit of soot or any condensation, and this without the possibility of preignition common to plugs with projecting porcelains. Each plug guaranteed. Price 4/-. Post free.

The Clincher A Won Rubber-studded Cover, size 26 x 2 or 26 x 2 1/2 in., 28/11.

The Bates Rubber-studded Cover, 26 x 2 in., 28/11; 26 x 2 1/2 in., 30/6; 26 x 2 1/2 in., 37/-. The Grose Steel-studded Cover, 26 x 2 in., 30/-; 26 x 2 1/2 in., 34/-; 26 x 2 1/2 in., 39/-.

Special Clearance Line of Continental Covers. Price, 26 x 2 or 26 x 2 1/2 in., 18/11. Postage on covers, 6d.

BOWDEN HANDLE-BAR CONTROL LEVERS. Single gear only, 4/6; ditto, with 4ft. of combined cable and stop, 8/4. Double lever, 6/-; ditto, with two lengths each 4ft. of combined cable and two stops, 9/8. Post free.

A New Design in Horns: "LA SERPENTINE." Emits a loud deep note equal to any car horn; finished in nickel; is fitted with dust sieve, best quality bulb, and is suitable for any handle-bar. Price 11/6. Postage 4d.

finished in nickel; is fitted with dust sieve, best quality bulb, and is suitable for any handle-bar. Price 11/6. Postage 4d.

A New Design in Horns: "LA SERPENTINE." Emits a loud deep note equal to any car horn; finished in nickel; is fitted with dust sieve, best quality bulb, and is suitable for any handle-bar. Price 11/6. Postage 4d.

finished in nickel; is fitted with dust sieve, best quality bulb, and is suitable for any handle-bar. Price 11/6. Postage 4d.

Illustrated Catalogue Free.

THE "PATCHQUICK" REPAIR OUTFIT. Containing "Patchquick" patches, which amalgamate with the tyre, and are not affected by heat

or friction. Used in conjunction with the "Patchquick fix," a repair can be executed that is equal to any vulcanising process. Price 3/-. Post free.

THE H.S. VALVE SPRING LIFTER.

By means of the compound action the stoutest spring is easily raised by a slight turn of the winged nut, leaving both hands free. Price 2/6. Post free.

HANDLE-BARS.

Best quality only. Length, 23 inches. Price 8/9. The P.M. pattern, as illustrated; length 18 in., stem 7 in. or 1 in. Price 7/6. Postage on handle-bars 6d. extra.

THE H. S. REPAIR BAND.

A useful accessory for cuts or gashes in your outer cover. Consists of a rubber band with canvas lining. No solution necessary.

is fixed by being tucked between rim and cover. Price 1/-. Postage 2d.

THE AUTO ACCUMULATOR JACK.

For securely fixing Batteries to prevent them moving in the box. Accumulators cannot move

or the celluloid be damaged by vibration. Solid brass. Price 9d. each. Postage 1d.

THE HUNT ALL-METAL HANDLE-BAR SWITCH

Price, one-way, 2/3; two-way, 2/9. Postage 2d. The design of this switch is so extremely simple that there is nothing in it to get out of order; the contact is quick and definite for both make and break. The whole of the switch is made out of heavy sheet brass well finished and nickel plated, the terminal is insulated with extra large ebonite washers, and the fixing clip is attached by a bolt and nut passing through the sides of the metal case, thus ensuring a reliable attachment to the handle bar.

BOX SPANNER, specially made for motor cycle use, including tommy. Sizes 27, 28, 29, 30, 31, 32, 33, 34, 35, 36, 37, 38, 39, 40, 41, 42, 43, 44, 45, 46, 47, 48, 49, 50, 51, 52, 53, 54, 55, 56, 57, 58, 59, 60, 61, 62, 63, 64, 65, 66, 67, 68, 69, 70, 71, 72, 73, 74, 75, 76, 77, 78, 79, 80, 81, 82, 83, 84, 85, 86, 87, 88, 89, 90, 91, 92, 93, 94, 95, 96, 97, 98, 99, 100. These sizes fit all nuts on a standard machine. Price 2/6 per set, postage, 3d.

COILS.

We only stock the well-known manufactures, whose name is a sufficient guarantee as to workmanship and quality. The Fuller Non-trembler. Size, 2 1/2 x 3 x 4 1/2 in.; price 10/6. The Fuller Twin-cylinder ditto. Size, 5 1/2 x 3 x 4 1/2 in.; price 21/-. The Fuller Trembler Coil. Size, 2 1/2 x 3 x 4 1/2 in.; price 17/6. The Twin-cylinder ditto. Size, 5 1/2 x 3 x 4 1/2 in.; price 35/-. Post free.

LYCETT NEW MODEL TOOLBAG.

Size 9 1/2 x 5 x 4 1/2 in.; manufactured of the best hide; supported with strong metal girders running inside; is fitted with two outside pockets for oil and petrol squirt, and has two inside pockets for spares, plugs, etc. Price 7/6. The same bag may be had with tool roll attached to fold up inside. Price 8/6. Post free.

"MATCHLESS" SPRING FORKS.

Makes an old pattern machine up-to-date. Easily fitted, cheap, and highly effective.

Hundreds of testimonials from delighted purchasers.

Price 15s. 6d. per pair. Post free.

ACETYLENE HEAD LIGHTS.

Our stock of lamps is larger and more varied than any other retailer. We have the Lucas, Solar, Autoclipse, F.R.S., Powell and Hammer. The Pulco, plated, 4 1/2 in. lens mirror projector, as illustrated, complete with a four-hour generator and tubing, weight 30 ozs., burns four to five hours, will throw a beam of light 150 yards. Price, complete, 19/11. Postage 6d.

THE HELLESEN DRY CELL.

No corroding terminals. No acid. No charging. Always ready, clean, and dry. The "Flash." Height 6 1/2 x 4 x 2 1/2 in. Approx. mileage, with single-cylinder engine, 1500. Price 6/6. The "Flight" ditto. Height 5 1/2 x 4 x 2 1/2 in. Price 6/6. The "Midget" emergency ditto. Height 5 1/2 x 4 x 2 1/2 in. Will run approx. 300 miles. Price 4/4. Postage 6d. extra.

THE HUNT ACCUMULATOR.

One quality only—the Best. Well made. No leakage. No corroded terminals. Every one guaranteed. No. 1, 15 amp.; height, 5 1/2 x 3 1/2 x 2 in.; price 9/6. No. 2, 20 amp.; height, 6 x 4 x 2 in.; price 10/6. No. 3, 40 amp.; height, 6 1/2 x 4 x 3 1/2 in.; price 17/6. Postage 6d. extra.

SPEED INDICATORS.

The Bullard, 63/-; with distance recorder, 84/-. The Jones, 84/-. The Cowey, with distance recorder, 84/-. All models on show.

Owner :
Mr. George
Newburn.

COMMENTS

Sydney Jones

Belt Fasteners.

Several unlucky wights ruined the chances of their teams at Daventry by using unsuitable belt fasteners. "Hard luck!" said the onlookers, but I do not remember having broken a belt fastener for two or three years past. Riders should beware of fasteners in which the link consists of a narrow hook. I use two types. In one the link is not a hook at all, but resembles the link of a chain in being endless; in the other there is a hook, but it is a broad, flat hook, with so much thickness of metal that it cannot very well snap. I have never broken a fastener of either of these types. It is true a broken fastener is a trivial matter in ordinary riding, and only serious in a non-stop run. But why be bothered with "frangible" fasteners when unbreakable types are obtainable?

Tank Capacity.

I noticed during the team trials at Daventry that very few of the standard machines had sufficient tank capacity to carry fuel for 100 miles. Some of the riders had strapped or screwed on extra petrol tanks, with flexible connections to the main tank stopper, while others carried reserve supplies in oilcans slung round their necks. This is due to the dual craze for lightness and efficiency. When one maker advertises a touring $3\frac{1}{2}$ h.p. at 150 lbs. other makers have to get down to the same mark somehow, and lightening the tank is a simple way of paring off a few ounces. Again, modern engines are naturally rather thirsty, and so the supply does not go as far as it used to. But I cannot help thinking that any genuine roadster should carry sufficient petrol to cover at least 120 miles of flat road at eighteen miles per hour. Makers might meet the objection by listing a larger tank as an extra.

The Team Trials.

Two organisations deserve our congratulations on the success of the team trials. The first is the M.C.C., which made the most perfect arrangements, handling a huge crowd of rather inexperienced riders with speed and smoothness. The other is the A.C.U., which at last unbent sufficiently to issue a permit licensing all the competitors to ride in competition for one day only without paying 2s. 6d. apiece to headquarters—a notable precedent, the imitation of which in future will save a good deal of unnecessary friction. I have only one suggestion to offer to the M.C.C. A number of riders were compelled to dismount by cattle on the roads, seven or eight being stopped in a bunch by one herd of cows. It is, of course, impossible to keep the roads clear of such obstructions, but when riders experience traffic stops in a non-stop competition there is always the possibility of subsequent difficulties; I remember several instances. Perhaps a yokel tells an official afterwards, "I seed No. 336 get off his sicycle; yus, I did!" The tale goes round. No. 336 has perhaps cleared himself in the eyes of the officials by reporting his stop to the timekeeper at the first opportunity, but after the stop he feels a little

uncomfortable lest accusations should be made against him, and possibly rumour attaches some suspicion to him ever after. When there are lots of officials patrolling the course, and the course is a short one—both of which conditions were fulfilled in the team trials—it might be a good thing to detail a marshal to follow cows, restive stallions, etc., till they leave the course, so that riders who are thus compelled to dismount should be relieved from any discomfort as to whether they will be credited with a non-stop run.

Big Valves.

I notice that a good many 1909 machines are fitted with inlet and exhaust valves of a far larger diameter than was formerly customary. In most cases the greater width of the head has been compensated for by increasing the bulge at the neck where the stem joins the head, but even so I expect there will be a goodly percentage of broken exhaust valves during the year, as the smallest increase in the diameter of the head throws a vastly increased strain on the neck. Riders of machines possessing these enormous valves will do well to make the carrying of a spare valve an invariable rule, and they will be wise if they take out the valve and examine it about once in a thousand miles. Most engines are now designed so that if a valve snaps across, the head cannot find ingress into the combustion chamber.

Spring Tension.

Every elementary handbook on motor engineering touches lightly on the fact that the tension of the valve springs is of some importance in tuning up a petrol engine, but I wonder how many amateurs realise the immense difference which weak and strong springs on the valves of such an engine really make. I was in a testing shop the other day where a firm of engineers were being grievously disappointed with the slow running of an engine from which they expected to get a very high rate of revolution indeed. Tested by a revolution counter, it was only running up to 2,200 r.p.m., which, of course, is a very ordinary speed indeed for a light cycle motor. The next day I saw the same engine tested with a new set of much stiffer exhaust and inlet springs. No other alteration had been made in the fittings or adjustments, yet the speed was now increased by about 1,000 r.p.m. The explanation of the starting contrast is obviously that, though ignition, carburation, and general design were adequate for the higher speed, the engine could not attain it with weak springs simply because the valves refused to operate fast enough. Makers generally fit their valves with a compromise in the way of springs. A stronger spring may, indeed, enable the engine to develop more power, but there are compensating disadvantages. With strong springs the valves pit more easily, the exhaust valve is more apt to break, real elasticity becomes impracticable, and the valve-lifting wire will stretch unpleasantly soon. However, the above facts may interest readers who compete in sprint events occasionally.

M.C.C. Team Trial.

It was stated last week that R. H. Edwards was one of the Birmingham M.C.C. team and covered the course without a stop. It transpires that this rider did not start, his place being taken by Reg. Samson, who rode a $3\frac{1}{2}$ h.p. L.M.C. motor bicycle and obtained full marks.

Police Trap.

We have received information of a police trap two and a half miles out of Kidderminster on the Worcester Road. The trap is shifted from time to time, and sometimes is situated on the Kidderminster side of Ombersley. There are also rumours of another trap on the Bridgnorth Road.

The Third Quarterly Trial of 1909.

The next quarterly trial is on Wednesday, the 28th inst., over the usual course from Uxbridge to Banbury and back. We read that the reason for holding this trial on a Wednesday is to give those competitors who find it difficult to be away from business on Saturday an opportunity to compete.

The Tour de France Trial.

The annual Tour de France reliability trial for motor cycles and voiturettes, organised by L'Autocycle Club, has been postponed until July 25th-August 1st. The total distance to be covered is 1,800 kilometres, the route being *via* Paris, Nancy, Besançon, Nevers, Poitiers, Rennes, Caen, and Paris. This trial will be described and illustrated in *The Motor Cycle*. Entries at ordinary fees close on the 10th inst., to L'Autocycle Club de France, 23 et 25, Rue Jean-Jacques-Rousseau, Paris.

The Road Surface on the Trials Route.

We have to thank a number of readers for sending us reports on the condition of the road on the six days' trial route. Letters on this subject from Messrs. W. H. Morgan (Salop), J. O. Hughes (Shrewsbury), J. B. Webster (Kidderminster), H. Horton (Leominster), H. P. Potts (Broseley), J. R. Wilkins (Derby), J. H. Davis (Leominster), C. Plumb (Crewe), J. Horswill (Chester), G. G. Croft, and I. Kenmore were forwarded to the secretary of the A.C.U. last week, and the information is proving of service to competitors and officials alike.

A Misdescription.

For describing a sidecar as a "Chater-Lea" when it was not so, a Mr. D. Jackson has been ordered by the Clerkenwell Bench to return the money paid (£5 15s.) to the buyer, Mr. G. Want, of Barnsbury, and also to bear the costs of the action.

Three Silver Cups and Two Gold Medals in One Week.

The above is the record success of Mr. P. H. Cockcroft, an enthusiastic Leeds motor cyclist, and a rider of a Triumph. He gained the Langton silver cup and gold medal in the Leeds-Edinburgh and back trial promoted by the Leeds M.C.C., and won the York County M.C.C. Palmer cup outright in the same event. His success in the York County M.C.C. twelve hours' trial for the Triumph cup accounts for the other cup and gold medal.

A. V. Sumner, who is riding a speed Humber in the Six Days' Trials, bridge on competitors

Sumner, who is riding a speed Humber in the Six Days' Trials, bridge on competitors

Products of Six Countries Represented.

Although French, German, Austrian, Belgian, and American motor cycles were represented in last Wednesday's race at Brooklands, an all-British machine scored an easy win.

Address Wanted.

Will Mr. C. Brown, who wrote to us about a steam motor bicycle, and whose residence was given as "398, Devonshire Road, Forest Hill, S.E.," kindly communicate with the editor, as a letter forwarded to that address failed to reach him.

Scottish Five Days' Open Reliability Trial.

In connection with the above event, Mr. Campbell McGregor, hon. trials sec. of the organising club, would like to draw the attention of intending competitors to the fact that the Edinburgh M.C.C. has affiliated to the S.C.U., and that it will be necessary for all competitors to be licensed riders. Consequently, no licensed rider may have any fear that competing in this event will render him ineligible for competing in any other open event. Intending competitors in this trial should note that no entries will be accepted after the 12th inst.

The Team Trials for "The Motor Cycle" Cup.

In the team trials at Daventry fifty-one single-cylinder machines made non-stop runs, and fifteen twin and four-cylinder machines. In view of this unfavourable comparison of the multi-cylinder machines, it is only fair to add that the winning team consisted of five riders of twin-cylinder machines, only one riding a single-cylinder. Another peculiarity about the M.C.C. team was that it was the only one with two-passenger machines in it.

Mr. H. E. Davidson, who was one of the North Islington Conservative and Unionist M.C. team, points out that he made a non-stop run on his $3\frac{1}{2}$ h.p. Rex, the twenty-six and a half miles he was credited with being the mileage accomplished by H. J. Compton, another member of the team.

A Streatham reader considers that not enough has been said of the performance of the St. Albans team in the trials. He points out that every man went through without the loss of a single mark, and if the non-starter had turned up it is reasonable to suppose that with a full team the M.C.C. win would not have been just as easy.

A.C.U. Six Days' Trial.

The total number of entries received for the Six Days' Trial was seventy-five, four entries being received by the A.C.U. after our last issue had gone to press. There was only one absentee.

Olieslagers, Champion of Belgium.

In wet weather, the track being somewhat treacherous in consequence, the motor cycle championship of Belgium, over ten kilometres, was decided at the Velodrome de Karreveld, Brussels, last week. Olieslagers, who has held the title for six years, again won, but a surprise was furnished by the brilliant form of Simon, who, riding with great daring, was only just beaten on the post by Olieslagers in the last fifty metres. André was close up. In 1904 Olieslagers, it will be remembered, paced Walthour to victory in the 100 kilometres world's championship at the Crystal Palace. The speedy rider is twenty-six years of age, stands 5ft. 7in., and scales 10 st. 7 lbs.

Proposed Professional Olympic Games.

A great carnival of professional sport of a week's duration on the lines of the Olympic games held last year, will in all probability be decided during the last week in August at the Stadium. Already most of the world's professional athletes and cyclists have agreed to compete for the large money prizes, that for the track Marathon race alone being £2,000. It is to be hoped that in framing the programme a motor cycle professional Olympic championship will be included in the sports.

First Aid Tricar for Bromley.

Following the last fire—£15,000 damage being caused by a lighted match being dropped near the engine of a chaff-cutting machine that had been cleaned with petrol—Bromley Urban District Council has decided to purchase a motor fire engine and also a first-aid motor tricar, similar to that owned by the Beckenham Fire Brigade, this machine being amongst the number at the Bromley fire referred to.

The Leather Casque again Proves its Worth.

After the race meeting at Brooklands last Wednesday a number of motor cyclists indulged in practice spins on the track, during which an unfortunate accident occurred. W. E. Cook, the rider of the 7 h.p. N.L.G., was travelling well over a mile a minute, when he was suddenly unseated, and sustained a very bad fall. It was fortunate for him that he was wearing a leather helmet, as this saved his head from damage, but his arm and hands were badly lacerated.

New York Policemen Motor Cyclists.

Many of our readers are doubtless aware that New York has a corps of motor cycle policemen. A number of these held a race meeting last month under the auspices of General Bingham, the Police Commissioner of New York City. In England it is hard to imagine our constables and sergeants taking part in track races. Were there motor cycle policemen in this country,

there would undoubtedly be less persecution, the real road hog would be wiped out, and the careful drivers would be free from molestation.

A Hill Climb for Standard Machines.

The Bradford M.C.C. is holding an open hill-climb on July 17th at Denholme Steep, and the officials are tak-

north on that date. "Ixion" wishes them every success, and trusts they will succeed in limiting the roadster classes to genuine tourist machines. If they do, their competition will be the first of the sort for several years.

Motor Union Notes.

The M.U. has been approached by certain of the motor cycling members with an offer of assistance to the War Office in connection with the cavalry manœuvres in September next to act as despatch carriers. As these motor cyclists would be, so far as possible, men of experience either with the Regular Army or Auxiliary Forces, they should be able to render good service in such manœuvres.

The Rev. F. Peel Mears, Northaw, Herts., who has had considerable experience with motor cycling, has been elected a member of the Motor Cycle Committee.

Forty-seven motor cyclists have been enrolled as individual members during June.

Owing to the inability of the Rev. F. W. Hassard-Short, chairman of the Motor Cycle Committee, to attend the deputation of the Motor Union to the Chancellor of the Exchequer on the question of taxation, Mr. Martin J. Tuchmann, who is also a member of the committee, was appointed to represent the Union on behalf of motor cyclists.

FUTURE EVENTS.

- July 5-10—THE A.C.U. SIX DAYS' RELIABILITY TRIALS. Centre: Shrewsbury.
- " 10-19—Motor Union Tour to South Wales. Speed Trials on Pendine Sands, Carmarthen Bay.
- " 13—Irish End-to-end Open Reliability Trial for Palmer Trophy, promoted by the Ulster Centre M.C.U.I.
- " 14 (Wednesday)—British M.C.R.C. Fourth Members' Meeting at Brooklands.
- " 17—M.C.C. 24 Hours' Reliability Ride for motor bicycles
- " 17—Bradford M.C.C. Open Hill-climb.
- " 19-23—Scottish Open Reliability Trial for motor cycles, Edinburgh to John-o'-Groat's and back.
- " 28 (Wednesday)—A.C.U. Quarterly Trial. Uxbridge to Banbury and back.
- " 25-Aug. 1—The Tour de France Reliability Trials, organised by the Auto Cycle Club de France.
- " 31 & Aug. 2—Race Meetings at Brooklands.
- Aug 2-3—Open 400 Miles Reliability Trial for Muratti Trophy, in connection with the Ulster Centre M.C.U.I.
- " 2—Motor Cycle Races at Cambridge Mammoth Show.
- " 2—Motor Cycle Racing at St. Albans Hospital Sports.
- " 18—British M.C.R.C. Meeting at Brooklands.

ing measures to bar special machines from the roadster classes. They wisely do not attempt to define what is and what is not a standard machine, but have appointed a committee of scrutineers to examine the machines entered, and to decide which machines shall be ridden in roadster classes, and which in racing classes. They have further fixed a minimum weight for riders. They have very kindly invited "Ixion" to act on the committee of scrutineers, but unluckily his engagements do not permit him to be up

Motor Cyclists' Wants.

Is it not high time that the organisations which exist for the benefit of motor cyclists took steps to prove to their own satisfaction that motor cycle members are obtaining proper treatment, from all officially appointed garage owners? During a motor cycle tour undertaken recently we were twice refused a less quantity of petrol than two gallons, the excuse being that it is too much trouble to obtain the necessary measures. In both instances an official sign was displayed.

A.C.U. SIX DAYS' TRIALS, JULY 5th TO 10th.

Competitors putting the final touches to their machines in the hotel yard at Uxbridge before the start.

Hertfordshire County A.C. Hill-climb.

FOR their successful hill-climb held last Saturday the Hertfordshire County Automobile Club members were favoured with glorious weather.

The competition was held on Aston Hill, near Tring, an acclivity often used for similar events, possessing the advantage of not being too severe, of having no dangerous turnings, of having practically no

Some of the competitors. At the extreme right is Leslie Munro (4 h.p. N.S.U.), second in Class C; next to him, F. W. Barnes (3½ h.p. Zenette), winner of Classes D and E. No. 42 is F. W. Applebee (5 h.p. Rex), while on his left is J. L. Norton (3½ h.p. Norton) winner of Class B.

traffic passing up and down it, and of being situated in a particularly pretty district. Although the hill road had been swept fairly clear of loose stones, the surface was exceptionally bad, as ruts and channels worn by rain water rushing down the hill caused many of the competitors to swerve badly. Only two horse-drawn vehicles made their appearance during the event, and it is with great pleasure that we have to record that the occupants of both behaved in a thoroughly sportsman-like manner. First came a two-wheeled cart, the driver of which waited until all the competitors in the class then running had gone by before descending the hill, while a little after three ladies in a Victoria starting for a drive changed their plans, sent their carriage off the course, enjoyed watching the fun for about a quarter of an hour, and then drove off in another direction.

Fifty-four Entries in Five Classes.

Fifty-four entries had been received, which were divided into five classes. Class A (for lightweight motor bicycles not exceeding 100 lbs. in weight), Class B (for machines with engines having a cylinder capacity not exceeding 85 × 85 mm., or an equivalent volume), Class C (for multi-cylinder machines, the cylinder capacity of which did not exceed that of two cylinders having a bore and stroke of 80 × 80 mm., or an equivalent volume swept out), Class D (for machines of any capacity),

and Class E (for machines fitted with change speed gears). In Class A, Fletcher (Moto-Rêve, 55 × 70 mm.) came up in excellent style, wonderfully fast for so small a machine. In Class B, Godfrey, Norton, Barnes, and Cooper all travelled well. But it was not until Class C was reached that the competitors began to switch off at the corners. Lee-Evans made a splendid ascent, but on his first attempt he was baulked by a team of cart horses which came on to the course through an adjoining gateway, so he was allowed another try, when he performed equally well. His machine was wonderfully silent. Other performances in this class which appeared good to the eye were made by Genn (who travelled very fast) and F. A. Applebee. Robinson's 2¾ h.p. Douglas came up slowly, but tackled the gradients in good form. In Class D Bashall on a Bat was clearly the fastest, while particularly good ascents were made by Evans, Robinson, Norton, Genn, Colliver, and Fletcher. It was in this class that Bashall distinguished himself by making the fastest time of the day.

The following is a list of the competitors in their order of merit on formula, the differences between them in minutes and seconds being noted, the fastest time in each class being represented as X:

CLASS A.—For lightweight bicycles not exceeding 100 lbs. in weight.

Rider and machine.	Marks.	Time.
G. L. Fletcher (2 h.p. Moto-Rêve)996 ...	X
W. Smith (2 h.p. Moto-Rêve) ...	1.228 ...	X+14 ³ / ₅
G. L. Andrews (2 h.p. Moto-Rêve) ...	1.370 ...	X+41 ³ / ₅

CLASS B.—Cylinder capacity limit 85 × 85 mm.

J. L. Norton (3½ h.p. Norton)765 ...	X+ 23 ³ / ₅
F. W. Barnes (3½ h.p. Zenith Gradua)786 ...	X+ 9 ² / ₅
W. A. Jacobs (3½ h.p. Rex)811 ...	X+11
H. Lister Cooper (3½ h.p. Triumph)821 ...	X+ 7 ³ / ₅
O. C. Godfrey (3½ h.p. Rex Speed King)837 ...	X
H. G. Potts (3½ h.p. Triumph)910 ...	X+134 ³ / ₅
A. E. Colliver (3½ h.p. Triumph)955 ...	X+19 ² / ₅
J. S. Harwood (3½ h.p. Triumph) ...	1.017 ...	X+21 ² / ₅
J. Seyfried (3½ h.p. Triumph) ...	1.170 ...	X+30

J. Seyfried (3½ h.p. Triumph) starting.

Hertfordshire County A.C. Hill-climb.—

F. W. Applebee (Twin Rex) climbing Aston Hill. A long stretch of the rise can be seen in the background.

CLASS C.—Multi-cylinders. Cylinder capacity limit 80 × 80 mm. for two cylinders.

W. W. Genn (4½ h.p. Eland)681	...	X + 2
Leslie C. Munro (3½ h.p. N.S.U.)904	...	X + 15
G. Lee-Evans (5 h.p. Indian)993	...	X
T. G. Baxenden (4 h.p. N.S.U.) ...	1.023	...	X + 29
W. H. Wells (5 h.p. Indian) ...	1.051	...	X + 9
F. W. Applebee (5 h.p. Rex) ...	1.176	...	X + 13
J. V. Robinson (2¾ h.p. Douglas) ...	1.197	...	X + 40
F. White (5 h.p. Rex) ...	1.211	...	X + 11
J. Stuart Shaw (4 h.p. Phänomen) ...	1.262	...	X + 25
A. Cumming (6 h.p. Matchless) ...	1.307	...	X + 11
F. A. Applebee (5 h.p. Rex Speed King) ...	1.340	...	X + 2
M. Krause (5 h.p. V.S.) ...	1.405	...	X + 17

CLASS D.—Motor bicycles of any power.

F. W. Barnes (3½ h.p. Zenith Gradua)791	...	X + 14
J. L. Norton (3½ h.p. Norton)809	...	X + 11
Leslie C. Munro (3½ h.p. N.S.U.)833	...	X + 17
E. A. Colliver (3½ h.p. Triumph)904	...	X + 20
W. W. Genn (4½ h.p. Eland)961	...	X + 5
G. Lee-Evans (5 h.p. Indian)996	...	X + 5
J. S. Harwood (3½ h.p. Triumph)997	...	X + 24
G. L. Fletcher (2 h.p. Moto-Rêve) ...	1.007	...	X + 23
W. H. Bashall (7-8 h.p. Bat) ...	1.057	...	X
M. Krause (5 h.p. V.S.) ...	1.107	...	X + 23
F. W. Applebee (5 h.p. Rex) ...	1.110	...	X + 19
J. Seyfried (3½ h.p. Triumph) ...	1.156	...	X + 33
J. V. Robinson (2¾ h.p. Douglas) ...	1.197	...	X + 46
W. Smith (2 h.p. Moto-Rêve) ...	1.212	...	X + 35
C. J. Stanley (7 h.p. Stanley) ...	1.333	...	X + 14

CLASS E.—Variable geared motor bicycles.

F. W. Barnes (3½ h.p. Zenith Gradua) ...	1.235	...	X + 39
T. G. Baxenden (4 h.p. N.S.U.) ...	1.386	...	X + 27
T. H. Tessier (7 h.p. Bat, P. and M. gear) ...	1.526	...	X

It is interesting to note how closely many of the competitors ran to one another in point of time. In Class E the riders were stopped between two flags fifteen yards apart and then restarted. F. W. Barnes (3½ h.p. Zenith-Gradua) lost time by not bringing his road wheels to rest soon enough. Baxenden (4 h.p. two-speed N.S.U.) also got away comfortably from rest, but managed well otherwise. Tessier (7 h.p. Bat, P. and M. two-speed gear) restarted in splendid style, but Webster (3½ h.p. Triumph, Gradua gear) stopped his engine while restarting. The results were worked out on the following formula: Time × h.p. ÷ weight. The following were the officials: Judge, Mr. S. J. Ellis; clerks of the course, Mr. Jenkins (who did excellent work with his 20 h.p. Rover car), Messrs. Webster and Saker; clerk of the scales, Mr. C. Lowry; timekeepers, Mr. F. Straight at the foot

and Mr. D. K. Hall at the summit of the hill; marshals, Messrs. H. W. Colliver and W. Young; secretary of the meeting, Mr. A. J. Salmon.

W. H. Bashall (7-8 h.p. Bat-Jap) making the fastest ascent of the day in Class D.

THE SYDENHAM BENCH AND DISPROPORTIONATE FINES.

THE A.A. has drawn our attention to a couple of cases heard before the Sydenham bench on the 16th ult. Below we give the newspaper reports, which surely lead one to suppose that the Sydenham bench have some motive other than that of public safety for inflicting such disproportionate fines:

A motor cyclist was fined £3 and costs for exceeding the speed limit by five miles an hour on the Shooters Hill Road.

A man was summoned by his wife for persistent cruelty. Complainant gave evidence to the effect that her husband was frequently drunk and abusive, had tried to cut her throat, to strangle her, and to burn her. Defendant did not contest the case, but it was practically dismissed upon his offer to do no more than his obvious duty, namely, consent to a maintenance order.

A similar parallel instance is given of cases heard before the Kingston Borough Bench, the motorist's fine in this case being £10.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Standard Machines in Competition.

[4114].—May we point out to Mr. B. H. Davies that the Rex Speed King model was publicly offered for sale prior to Sutton Bank, this being its first competition? May we also add that Sutton Bank was the first speed test in which a Rex has enjoyed the same advantage with regard to weight as other winning makes?

THE REX MOTOR MFG. CO., LTD.

Covered Vans in the Midlands.

[4115].—With reference to the A.C.U. reliability trial, July 5th to 10th, may I, as a motor cyclist knowing the Midlands very well, caution competitors about owners of carriers' carts? As far as I can make out, they seem to think they have absolute right to the road, and you may follow some for a quarter of a mile, blowing your horn for all you are worth, before they wake up.

If county councils have not the power to compel carriers to have their carts open at the back (the only remedy, in my humble opinion), then surely an Act of Parliament might be passed to this effect.

G. G. CROFT.

The End-to-end Record.

[4116].—I notice that Mr. Peck states he can give ample proof that, apart from changing a valve, no other mechanical adjustment was made. He evades, however, the all important point, viz., did he, or did he not, ride the same machine from start to finish? Mr. Peck must be well aware that in all events such as the Six Days' Trial and the T.T. races the machines are officially sealed; and no claim would be passed by the officials if the seals were not intact after the event.

A claim to have beaten the End-to-end record should be above all suspicion, and I understand that Mr. Bentley not only had his machine sealed officially, but the timekeeper even went by train to the other end to time the arrival, and to see that the seals were intact. In addition to this he took the number of the machine at the start and finish.

Unless Mr. Peck can give proofs that he actually did the ride on one machine, I for one shall still look upon Mr. Bentley as the holder of the End-to-end record.

EDMUND G. BURTON.

The Cat and Fiddle as a Test Hill.

[4117].—Just a line *re* Six Days' Trial and the Cat and Fiddle Hill, for the benefit of those who do not know this district.

Let no one be dismayed. At the end of the day all will be asking if they have missed it. To call this a "test" is surely a joke on somebody's part. I dare wager that there will not be a machine, unless previously put out of gear, that will fail to take this hill at over legal limit. It is beautifully graded and good surface, and on a pedal cycle I should never dream of walking any part of it. The first bit out of Macclesfield is paved, and the road rather narrow and steep, with little chance of getting up speed. Later on, at Walker Barn, the road turns sharp to the left with short sharp rise. Here the wind may strike the competitors and give them a check, but once past all is plain sailing.

I am sure there will be many hills encountered during the trial much more difficult than this so-called "test" hill. It makes one smile, and I can fancy I see the lightweight rider's huge grin as he finds himself flying up. Afterwards when he sells his machine he will brag about it.

H. KENMORE.

A Reader's Suggestion to a Coventry Firm.

[4118].—I think most people who have ridden Triumph single-cylinder bicycles, and who will thus have seen how nearly perfect they are, must wish that this firm, "the Purvey of motor cycle manufacturers," would make a two-speeded twin-cylinder machine suitable for passenger work, or even a tricar. Surely if a large number of people wrote to the company on the subject they would turn their attention to it.

PERFECTION.

The Taxation of Motor Cycles.

[4119].—Motorists throughout the country are crying out against the new taxes, but many of those who cry loudest and talk most about what the leading motoring organisations should do are unattached motorists.

May I point out that the leading motoring organisations are, as is known to the majority of your readers, doing their level best to contest these taxes and get them modified, but the good work they are doing cannot be done for nothing, and it is the duty of every motorist to back up the leading organisations by either joining such organisations or their local clubs.

ERIC W. WALFORD,

Hon. Sec. Coventry and Warwickshire Motor Club.

Twin Cylinders for Sidecar Work.

[4120].—I was interested in reading "Ixion's" comments *re* twins for sidecar work, but as there must be numerous people like myself who cannot afford a 5-6 h.p. twin, and have to content themselves with a 2½ h.p. single-cylinder, they may be deterred by those remarks from investing in a sidecar and thus obtaining the most enjoyable part of motor cycling. In my own case I bought a 2½ h.p. second-hand Westfield cycle (not now made), and after I had it about six months purchased a second-hand Montgomery flexible sidecar, and many a pleasant run have my wife and I had on this combination (total weight twenty-one stones). Of course, when I come to a hill like Hand cross I have to pedal hard to get over it, as also I have had to on portions of Hindhead, but when one's means are limited one has to put up with a few disadvantages. Again, as regards speed we came back from Brighton to Sydenham in two and a half hours a day or two ago, which is fast enough for comfort. Of course, I should prefer the higher-powered cycle so as to romp up all hills, but I think you ought to emphasise the fact that anyone who has a good 2½ h.p. machine need not be afraid to fix a sidecar to it if he doesn't mind a little pedalling on stiff hills and the passenger walking up "precipices."

EDWARD PARKIN.

Silence.

[4121].—Replying to your correspondent, Alex. F. Payne, whose letter on the subject of silent motor cycles appears on page 494 of your issue of last week, I would say that I have succeeded in rendering the engine of my 5-6 h.p. V.S. Twin as silent as the smallest lightweight by fitting a Clair silencer, the principle of which is that no flat surfaces are opposed to the passage of the exhaust gases, and, consequently, there is no rebound or frictional resistance, and therefore no back pressure. The exhaust gases pass through a series of metal cups, in each of which a number of holes is drilled, while there is a small space left between each of the cups at the bottom. I get the best results by arranging the cups so that the holes in them are alternately at the top and bottom, and not in a straight, corresponding line

through the silencer. This means that the gases have to take a circuitous course through the silencer in the same way that the products of combustion from locomotive fireboxes are made to circulate about the smokebox without coming in contact with flat surfaces in those locomotives fitted with spark arrestors, before being finally exhausted into the atmosphere.

I cannot speak too highly of the Clair silencer. Not only has it made my engine 95% quieter than formerly, but it has also improved its general capacity for work. The makers allowed me a seven days' free trial of the device, and I decided to keep it before the first day was out. I am not saying all this to advertise the Clair silencer, in which I have not the slightest financial interest, but merely because, having taken to heart your remarks at various times as to the desirability of motor cycles being more silent than at present, I had been hunting for a really efficient silencer, and have at last found one. CHAS. S. LAKE, A.M.I.M.E.

The M.C.C. London-Edinburgh Run.

[4122.]—I have much pleasure in informing you that at a committee meeting held on the 28th ult. it was decided to present to each member who was disqualified from a gold medal award under the fifteen minutes rule in the recent London-Edinburgh run a little memento of the ride. The exact nature of the memento has yet to be decided.

HARRY G. BELL, Trials Hon. Sec.

[4123.]—I am obliged for the insertion of my letter 4107. In your article on page 479 you state that the hon. sec. of the Motor Cycling Club says there were not any secret controls. To prove my statement is correct, I give below copy of letter sent by Mr. Harry G. Bell, the hon. sec. for the trials, to Mr. Percy Platt, of Oldham, giving the reason for the latter's disqualification. JAS. HOWARTH,

General Manager of Bradbury and Co., Ltd.

[COPY.]

P. Platt, Esq., Oldham.

June 17th, 1909.

Dear Sir,—In answer to your letter of the 16th, you have been disqualified for being found 6½m. ahead of time, i.e., 21½m. ahead of schedule time at one of the *secret checking places on the route*. Mr. Eastmead was also too early at the same place (6m.), also too early at the second place.

Yours faithfully,

H. G. BELL.

[4124.]—It is only too evident that considerable dissatisfaction has been caused by the operation of the fifteen minute rule in the recent London-Edinburgh-London run of the M.C.C. It is obvious that hardship has occurred in certain individual cases, such as a man taking a sidecar through 800 miles and receiving no award or appreciation of the fact, because, somewhere or other, he was more than fifteen minutes ahead of his time. Other men made otherwise good performances, but receive no recognition of their run. This risk tends to make the run unpopular, and at the same time does not penalise those who "blind," and yet are cute enough to keep within the letter, if not the spirit, of the rules.

My suggestion is that the gold, silver, and bronze medals for the single and double journeys (these should be different medals) should be awards on the same basis that the challenge cup award is made, viz., taking into account the total error from schedule times over the whole journey. Thus, supposing there were ten checks and the maximum error permissible for a gold medal were fifty minutes, the average error at each check would be five minutes, but to qualify for a gold medal the fifty minutes would not be exceeded. For silver medals the error permissible should be, with ten checks, about 130 minutes, whilst those completing the journey in the prescribed time, but whose error exceeded this, should obtain bronze medals.

Such a system of awards would favour the reliable machines and at the same time render the gold medals more valuable to the gainers. At present any scarebrain with sufficient money to buy a good machine can, with luck, win one, and I do not think that this should be so. The cup winner would be the head of the gold medal class, and the awards would represent more truly the skill of the rider with his machine.

Another point that occurs to me when conning over the rules is the position of Edinburgh to the return journey

men. I heard one man, with 400 miles still to go, told that he was disqualified from receiving any award whatsoever because he had arrived at Edinburgh too late. In this case, had I been running the show, I should have treated Edinburgh as an ordinary control, and started the man back by the amount he came in late, and given him a chance of earning some sort of award. If he had been an hour late at (say) Newcastle he would not have been disqualified, so why at Edinburgh? Under my scheme he would have some chance of retrieving himself on the homeward journey. The one town is no more the finish of his run than the other.

I put forward these suggestions because I think that they are a good solution of the problem, and also because I think that, in these days of reliable machines (as noted in your leaderette), the skill of the rider should weigh equally with the efficiency of the machine. F. G. SMITH.

[4125.]—I have read Mr. A. E. Catt's letter, but really cannot see the logic of this gentleman's complaint.

He apparently after reading the conditions duly entered for the above run, and now, as he frankly admits, after violating the rules, which by entering he agreed to accept, he imagines he has a grievance against the M.C.C. committee.

I happened to be one of those individuals who, after fully understanding the rules, omitted to ride in accordance therewith, but surely it would be unsportsmanlike of me to complain under such circumstances because I am not awarded a medal. Personally, I think it better to put the incident on the credit side of my experience account, and thereby be in a better position to qualify for an award on some future occasion.

The only way to prevent riders getting ahead of time is to disqualify, and to organise a number of secret checks, or a greater number of open checks, would, in my opinion, make the competition less enjoyable, therefore less popular. We should even then have some men who, like your correspondent, would expect special treatment after they had failed to qualify for a prize.

The last paragraph of Mr. Catt's letter, I fear, is somewhat vindictive in spirit, and his sentiments will not be endorsed by many of my fellow club members. Surely the committee are under obligation to serve the best interests of all sections of the club, and it would certainly be unfair to non-competing members, also to winners of awards according to the rules, for club funds to be expended on prizes.

Team Trials at Daventry. A rider of a four-cylinder F.N. being pushed off from the start. These machines always attract attention by reason of their silent and smooth running.

which had not been won in accordance with the rules and regulations governing the club competitions as set forth on the entry forms.

GEO. E. ROBERTS.

[Other letters bearing on this subject have been received, but the above will suffice. We may here remind readers that letters bearing the writer's signature are given preference in all cases.—Ed.]

M.C.C. Team Trials for "The Motor Cycle" Cup.

[4126.]—I shall esteem it a favour if you will allow me through your columns to express my very sincere thanks to the many willing helpers who were good enough to assist me in making the team trial for *The Motor Cycle* Challenge Cup. The success that it turned out to be on Saturday last.

I thank the clubs for the large number of entries, making the event a truly representative one, and I feel that, were it not for the kind help of the many members and friends who turned out with the idea to put a shoulder to the wheel, my own club would have had a very heavy task of handling the large entry we had to deal with. My wish is to thank each one individually, but in many cases this is the only way I have to communicate with many of the club members.

In conclusion, I hope that when the next competition takes place I may be favoured with as good an entry and as much help, and wish those teams that fell short of the coveted 600 marks better luck next year.

J. VAN HOOYDONK.

Two-stroke Engines.

[4127.]—I have noticed lately quite a discussion in your most excellent paper on two-stroke motors, and as I have been interested in this class of engine for a considerable time now, I should like to have the opportunity of informing you that I designed one of these seven years ago privately at home, and find from my accounts that the first set of patterns for test engine was delivered to me on Dec. 10th, 1904. Unfortunately, I was unable to push it much at that time, although on second thought I do not think it would have been so well taken up at that time as is likely to be the case at this moment. I might mention I have protected my designs in this country, on the Continent, U.S.A., Canada, and in Australia. These cover various styles suitable for cars, cycles, boats, or stationary purposes. The principal is a two-stroke cycle with duplex cylinders, there being two explosions per revolution. The cylinders being in pairs, and the cranks at opposite angles, an impulse is given every half revolution. Thus the firing conditions equal a four-cylinder engine. The mixture is not taken into the crankcase, as is usual with most engines of this class, and therefore is not polluted with the splash of lubricating oil, or affected by wear in the bearings and consequent leakage of compression in crank chamber; also the possibility of taking in air through bearings, upsetting the quality of mixture. Moreover, the compression on mixture in crankcase cannot be constant, due to the varying quantity of lubricating oil in crankcase. In my design any number of pairs of cylinders may be arranged along or around a crankcase. It is also a valveless engine. Two test engines of different design have been made, the results from which have been most gratifying. Constant speeds can be kept up anywhere between 200 and 1,600 revolutions per minute. The control is most flexible on either the electric ignition contact, mixture throttle, or air inlet. A motor specialist stated on inspection recently that the control and flexibility of running was far more perfect than any four-cylinder four-stroke car motor that had been through his hands. Further developments are in hand at the moment.

J. H. HOPKINS.

[4128.]—In reply to your correspondent, Mr. W. F. Ritchie, the system of "constant thrust" (whereby the reciprocating parts of the Scott motor are kept in inseparable contact with one another) is maintained at all speeds attainable on the road by means of a careful balance of cylinder pressures and reciprocating weights.

Since the load on the piston due to compression of the charge is always greater than the load due to inertia of the piston at all possible speeds on the road, the system of constant thrust is maintained even when the engine is switched off, as well as when firing.

It must first of all be understood that the cylinder pressure (due to compression of the charge) is only required to keep the piston under load at the end of the upward and during the beginning of the downward stroke, since at the end of the downward stroke the load due to the "resistance to retardation" of the reciprocating weights is sufficiently great to maintain the thrust on the crankpin, although for nearly a quarter of a revolution the piston is under atmospheric pressure only.

For example: At 1,500 revolutions per minute there is 176 lbs. load on the piston of the Scott engine at the beginning of the downward stroke, and 132 lbs. load at the end

of the stroke. The 176 lbs. initial load is arrived at by subtracting 202 lbs. (the effect of the inertia at the beginning of the stroke) from 378 lbs. (the load due to compression of the charge), while the terminal load of 132 lbs. is caused entirely by the inertia of piston and rod.

It will be seen from these figures that the length of connecting rod has a considerable effect in modifying the effect of inertia at the beginning and end of stroke, and that the general effect is to reduce the high initial load and to increase the terminal load on the piston.

THE SCOTT ENGINEERING CO., LTD.

[4129.]—I was very interested in letter 4093, but there are two points on which the Scott Engineering Co. might well enlighten us.

(1.) What happens to the engine if a crank-case explosion takes place? A friend of mine driving a two-stroke car with crank-case compression ruined his engine and nerves by switching on again at the bottom of a hill.

(2.) How will the engine pull at low speeds? It is very hard to get this type of engine to run slowly. In many cases there is only one speed at which it will run satisfactorily. This is due to the fact that the ports of a two-cycle engine designed for high speed are unsuitable for slow running and *vice versa*.

Again, why is the displacer pump motor unsuitable for motor cycles? Certainly it is a little more complicated, but it has the advantage of being able to pull harder at low speeds than the Day type, and, since exhaust ports can be cut all round the base of the cylinder, there is a better chance for exhaust to escape. The weight and bulk need be very little greater than for a single-cylinder four-stroke; the displacer and its parts can be very much lighter than is usual in a working cylinder.

There is another large two-cycle engine on the market, the Oechelhauser, which contains the germs of the ideal cycle motor, and are given below:

(1.) It is balanced, and absorbs most of its own vibration. For this cycle it is essential that two pistons be fitted to a cylinder which move in opposite directions, as in the Gobron-Brillié engine, and it is balanced on the same principle as the Douglas and Gobron engines.

(2.) It is valveless. One piston uncovers exhaust port near the end of its stroke, the other immediately after uncovers an air inlet port, allowing cool air to blow most of the exhaust out at the other end, and further movement uncovers a mixture port, admitting mixture to cylinder.

(3.) Impossibility of premature explosions. The fresh mixture is separated from exhaust by cool air.

(4.) Exhaust is properly scavenged.

To make a neat job of it this engine would have to be exceedingly carefully designed. A very compact way of arranging the parts has occurred to me, and I will send a sketch of it if of interest.

Some people may object to the double-acting air pump necessary to provide the slight pressure of air and mixture, but as this always runs cool there is no reason why it should give trouble.

H. E. RENDALL.

EXPERIENCES WANTED.

"A.F.P." (Harborne) would like readers' experiences of (or suggestions for) springing the back wheel of a $4\frac{1}{2}$ h.p. water-cooled tricar. Weight about 2 cwts.; belt-drive.

"H.U.G." (Eastbourne) desires readers' experiences of the twin Motosacoche. Is it liable to skid?

"A.O.C." (Co. Dublin) would like readers' experiences with the Scott two-stroke motor cycle.

"P 4176" would like readers' experiences of the Osborne four-speed pulley in conjunction with any $3\frac{1}{2}$ h.p. standard machine.

"Renut" (Louth) desires readers' experiences re running the F.N. lightweight, particularly as to making it run quietly.

A twisting handle grip which has been designed to operate a wire controlling carburettor or magneto. Around the outside of the bar is coiled a wire as shown which is secured by soldering. The slide to which the controlling wire is attached is caused to move backwards or forwards by rotating the handle.

PALMER TYRES

Are **STRONG & DURABLE.**
NON-SKIDDERS.
CLEAN & COMFORTABLE,
ALMOST IMMUNE
FROM PUNCTURES.

Write for Manual.

The Palmer Tyre, Ltd.,

119, 121, 123, Shaftesbury Avenue, London
W.C.

1908 WINS

ON
**PALMER MOTOR
CYCLE TYRES.**

8 Cups & Trophies,

30 Medals,

4 other prizes.

BEAR IN MIND 'THE SIMPLICITY.

? Have you ever considered the absolute lack of complication in the magnificent **GRADUA GEAR**

which is creating such a sensation in the Motor Cycle world.

160 variations between free engine and $3\frac{1}{2}$ to 1.

Direct drive on all speeds—no jockey pulley—no slack belt.

Handle-starting. Free engine. No end thrust.

No sudden jamming in of gear, and wear and tear to the machine. No necessity to let the engine slow down—the engine speed is kept up by reducing the gear as gradually as you desire—thus the full efficiency of the engine is retained. The "Gradua" Gear flattens all hills.

THE EVER SUCCESSFUL "ZENITH"

$3\frac{1}{2}$ h.p. Fafnir Engine, Fafnir or Longuemare Carburetter, Whittle or Rubber Belt, Druid Spring Forks, Brooks' Saddle, $26 \times 2\frac{1}{4}$ in. Clincher Tyres, Michelin Butt-ended Tubes, Handle-bar Control. Gear-driven Bosch Magneto. Price 38 guineas nett cash, or with **GRADUA GEAR**—as illustrated—49 guineas nett cash. A machine on view at the Service Co., London.

We will gladly send particulars on receipt of a postcard, or will welcome a personal visit. If you come there will be no importunity to purchase.

ZENITH MOTORS, Ltd.,

WEYBRIDGE, SURREY.

Telephone No. 4, Weybridge.

"The 'Gradua' Gear adds more than fifty per cent. to the comfort, enjoyment, and safety of motor cycling." *Vide letter of enthusiastic rider*
GRADUA GEAR.

The Gradua Gear is the greatest achievement in motor-cycle engineering. A single turn—or partial turn (as the case may be) of a small wheel—suffices to give a gear of 4 to 1, $4\frac{1}{2}$, $4\frac{1}{4}$, $4\frac{1}{2}$, or 5 to 1, 6 to 1, 7 to 1, or any gear desired down to free wheel. We fit the gear to our own machines only.

We have also brought out a conversion on our "Gradua" Patent principle which we will fit to "Triumph" motor bicycles (only). If you possess a "Triumph" write to us at once for a quotation for fitting your machine with the Gradua Gear. We do not supply the gear or parts separately; we only undertake the conversion ourselves.

THE LUXURIOUS "ZENETTE"

or "Double-Scissors" Spring Frame. Every part of frame is alive to absorb shocks. Perfectly steady—low centre of gravity—side-play absolutely impossible. Enormous saving of wear and tear. Price with $3\frac{1}{2}$ h.p. Fafnir Engine, finest fitments, accumulator ignition, 39 guineas nett cash. With **GRADUA GEAR**—as illustrated—50 guineas. A 4 h.p. J.A.P. engine can be fitted to either machine for 2 guineas extra.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—9d. per line of 8 words; minimum, 3 lines. Name and address must be counted. In the case of Trade Advertisements a series of ten insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Thursday morning, or if sent by London (20, Tudor Street, E.C.), by the Wednesday afternoon previous to the date of publication.

All letters relating to advertisements should be distinctly under what heading and in what form the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Telegrams: "Primus, B'ham."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be forwarded for forwarding replies. Only the number will appear on the advertisement. Replies should be addressed, "The Motor Cycle, Coventry"; or if "London," "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown parties may deal in perfect safety by availing themselves of the Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, upon intimation of the arrival and acceptance of goods, the money is forwarded less a charge of registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. Deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Messrs. Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive answers to their enquiries are requested to regard silence as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to more by post.

MOTOR BICYCLES FOR SALE

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

2½ h.p. Rover and spares, perfect, splendid condition, £15, or nearest offer.—Pickles, 57, Elleswell Road, Newcastle.

3½ h.p. Triumph, 1907, guaranteed perfect, with spares; seen any time; £25.—Dyer, Sydenham Rd., West Hartlepool.

MOTOSACOCHE, new last year, spring forks, splendid condition, and first-class running order; £20.—Pringle, bootmaker, Morpeth.

1½ h.p. F.N. Lightweight, magneto ignition, new year, smart little machine; clear 18 guineas.—Turvey and Co., The Motor People, Sunderland.

1907 3½ h.p. Fafnir, Chater-Lea, magneto, Phelon Moore two-speed gear, splendid order; £30, near offer.—D. Wright, 99, Stanton St., Newcastle Tyne.

3½ h.p. Rex, in good running order, strong, reliable machine; a bargain, £9.—Turvey and Co., agents for Triumphs, Humbers, N.S.U., etc., The Motor People, Sunderland.

3½ h.p. Minerva, heavy tyres, detachable tubes, variable pulley, two belts, numerous spares, Riches tyres, and complete machine, first-class order; guineas.—115, Sorley St., Sunderland.

1908 3½ h.p. Minerva Motor Cycle, fitted with magneto, spring forks, B. and B. handle-bar control carburetter, guaranteed perfect; any trial given.—£24.—Bolsover, Solicitor, Stockton-on-Tees.

5 h.p. Rex, twin, powerful, fast machine, winner several competitions; price £17 17s.—Above can be seen and tried at Turvey and Co., The Motor People, Sunderland. Agent for Triumph, Humber, N.S.U. Write for lists.

SECTION II.

York and Lancashire.

DOUGLAS, Lincoln Elk, and Norton motor cycle stock.—Gourlay, Fallowfield.

3½ h.p. Rex, spring forks, low, in good running order, a bargain, £12.—Church Villa, Ince, Wigan.

3½ h.p. Ariel, complete, perfect order, little used, £16 fittings; £16 cash.—Russell, Lawrence St., York.

MOTOSACOCHE, sound condition 1908 model; £12 cash.—Alf. Reed, 63, Dale St., New Marske-by-the-Sea.

3½ h.p. Rex, very fast, tyres unpunctured, perfect; price £12 10s.—Hart, 359, Oxford Rd., Manchester.

TRIUMPH, late 1907, handle-bar control, good condition, run 4,000 miles; £26.—Kerr, Mayfield, Halifax.

1908 Triumph, guaranteed perfect, Hella lamp, spares, what offers?—Buckley, 16, Mosley Manchester.

£9.—Twin Werner, going order, long bars, low; Phenix Cob, two-speed, magneto, late 1907, with tricar attachment as spare, £34.—Gregson, Grange, Chorley.

In answering these advertisements it is desirable to mention "The Motor Cycle."

MOTOR BICYCLES FOR SALE.

1 h.p. Peugeot, lightweight, low, fast; £7.-86, New King's Rd., Fulham.

1 h.p. Carlton, faultless; £6 10s. or offers. — 124, 4 Dennett's Rd., New Cross, S.E.

1 h.p. Twin Minerva, new last June; what offers? — 2 — Motorist, 53, Highgate Hill, N.

1 h.p. Brown, 1907, in splendid condition; £14.-20, Knight's Hill, West Norwood.

TRIUMPH, 1906, magneto, in splendid condition, fit for touring; £22.—Morgan, Farnham.

FIRST-CLASS Motor Cycle, twin-cyl., 6 h.p., like new; £24.-70, Fortess Rd., Kentish Town.

If you want bargains in second-hand, exchanges, or new, come to 5, Heath St., Hampstead.

9 10s.—2 h.p. Minerva, splendid condition; any trial; long bars.—444, Old Ford Rd., Bow, E.

9 09 Rex de Luxe, two-speed gear, almost new; £39.—Rey, 5, Heath St., Hampstead, N.W.

WIN Antoine, accessories, spares, perfect condition; £17.—29, Eccles Rd., Clapham Junction.

1 h.p. Twin Minerva new last June; what offers? — 2 — G. Kennett, 46, Chapel St., Islington, N.

8.—3 h.p. Auto, vertical, Longuemare, in running order.—T. Gilston, Church Av., Sidecup.

TRIUMPH, 3 h.p., perfect running order; bargain, £10 15s.—W., 112, New King's Rd., Fulham.

h.p. Werner, in good condition; £8; engine overhauled recently.—J. Mitchell, 24, Lee St., Limehouse.

TRIUMPH-MINERVA 2 h.p. Lightweight, new tyres, many extras; £8.—190, Mellison Rd., Tooting.

1 h.p. Ariel, lamp, accumulator, spares, accessories, good order; £10.—South, Potteries, Tottenham.

A.P., 4 h.p., 1908, Chater-Lea fitting, magneto, very low; £25, bargain.—Rey, 5, Heath St., Hampstead.

1 h.p. Cycle for sale, in good order; £6, or nearest offer.—Barton, 2, Porter Rd., West Kensington.

N., 4-cyl., little used, accessories, tools, spares; £28, bargain.—34, Claverley Grove, West Finchley, N.

1 h.p. Werner, good running order; £10; can be seen any time.—Hewett, 99, Churchfield Rd., Acton, W.

HAMPSTEAD Bargains on page 36; finest stock guaranteed.—5, Heath St., Hampstead. Tel.: 2678.

1 h.p. Bat, two speeds, magneto and accumulator, fast, 2 reliable; £23.—D. Fellows, 49, Hertford St., May.

3 h.p. F.N.; £12; sell, or exchange for gent's cycle 4 and cash.—159, Plashet Rd., Upton Park, West m.

TRIUMPH Motor Cycle, magneto, splendid condition; £26.—W. Dale, 43, The Village, Old Charlton, nt.

N., 4-cyl., 1909, soiled only, all accessories; £32, bargain.—5, Heath St., Hampstead. Tel.: 2678.

h.p. M.M.C., low-built, perfect condition; £10.—3, Salisbury Villas, Walpole Rd., South Woodford, ex.

9 09 Wolf Lightweight, Druid spring forks, soiled only, all accessories; £28.—5, Heath St., Hampad.

6.—Minerva, 2 h.p., M.O.V., vertical engine, low machine, good condition.—38, Greenholme Rd., ham.

7 15s. (Look).—3 h.p. Ormonde, very fast, sound tyres, low position; real bargain.—39, St. Albans Rd., utford.

4.—2 h.p. Quadrant engine, frame, wheels, tanks, footboards, belt, gong, perfect.—57, North Rd. Av., entwood.

TRIUMPH, 1909, brand new, in stock; exchange entertained.—Rey, 5, Heath St., Hampstead. Tel.: 78, P.O.

1 h.p. 1907 Brown, perfect, little used, spring forks, 2 two accumulators, powerful; £14.—18, High St., ulsham.

QUADRANT, 3 h.p., in good condition; what offers, cash? appointment.—Thomason, 2, Broughton Rd., est Ealing.

1 h.p. Rex, fast, powerful hill-climber, tyres, everything perfect, spray; trial; £7.—17, Bedford, Steppney.

MINERVA, 2 h.p., fast, perfect, guaranteed good condition; £12, or offer.—Newton, 87, Bury Rd., od Green.

h.p. Twin Rex, handle-bar control, stand, carrier, spares, splendid order; £17.—Coombes, 737, High, Tottenham.

8.—Minerva, 2 h.p., good condition throughout, lamp, spares; bargain.—12, Rutland Park, illesden Green.

h.p. Fafnir, Chater-Lea frame, Dunlop tyres, Shamrock belt, good order; £11 10s.—Eagles and Co. gh St., Acton.

9 08 3 h.p. Rex, magneto, H.B. control, non-ski' tyres, lamp; £25, near offer.—Dines, 14, Ridg, Wimbledon.

8 10s., quick sale.—3 h.p. M.M.C. cycle, in good re pair; wants few adjustments; bargain.—30, Aroden, Brixton Hill.

COMFORT

Is the keynote of the age.

The value of a Motor Cycle is in the comfort it affords the rider. When designing the New 3½ h.p.

BRADBURY

the comfort of the rider was studied from every point of view.

The Diamond Frame is built into the engine case, dispensing with cradle, nuts, and bolts, and ensuring greater strength and rigidity than in any other type of Motor Cycle.

The BRADBURY Engine is placed in a central position, and the balance is as perfect as it is possible to make it, the rider having better control of his machine, more comfort, and experiences less vibration than in any other model.

The position of the rider of a BRADBURY Motor is comfortable in the extreme, and the Magneto Ignition, with Handle-bar Control, gives him a maximum of ease and comfort.

The BRADBURY is built low, with long wheelbase; it is fitted with the Bradbury Spring Fork Attachment and other up-to-date appliances to ensure the comfort of the rider.

The BRADBURY Engine is 87 by 87 mm., fitted with Ball Bearings. Interchangeable M.O. Valves, beautifully balanced Flywheels; and the best modern appliances, thus assuring the comfort of the rider to the greatest possible extent.

—O:O:O—

We shall be pleased to mail you the New BRADBURY Motor Booklet describing the Best British-built Motor Cycle, and send you name of our near st Agent.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

The Six Days' Trials.

BY the time this issue is in the hands of our readers the 1909 Six Days' Trials of the Auto Cycle Union will be concluded, and we shall know a great deal more about the capabilities and reliability of 1909 models than we have done up to the present. Unfortunately for the competitors, the trials have not been favoured with particularly fine weather, but as trials are organised for the purpose of showing the capabilities of motor cycles under all conditions, it is perhaps not altogether unfortunate from the buyer's point of view that the machines have had to encounter adverse conditions in the way of heavy roads, showers of rain, and steep hills. Gradients are, of course, very much more difficult to ascend when the roads are wet. If the trials have shown the necessity of one thing more than another, it is the use of a good change speed gear. The steep hill at Dinas Mawddwy in Wales unseated over half the competitors, and, although they might have been able to have kept in the saddles with a very much lower fixed gear, it is very irksome to drive a motor cycle with a gear low enough to enable it to tackle any hill in the country, when with a variable, or two-speed gear it is possible to have the engine turning round comfortably under all conditions of gradient and surface. That the perfect motor cycle change speed gear has not yet been devised is quite as apparent as the demand for a gear, particularly among heavyweight riders. More than one competitor with a variable geared machine found Dinas Mawddwy too much for his gear ratio. Hills are not the only obstructions which cause the use of a change speed gear to be appreciated. Traffic, greasy roads, start-

ing, etc., are all rendered very much easier with the aid of a low gear. We notice that the organisers have discarded the appearance awards as far as concerns the riders. It is questionable whether this is wise, as it must be patent to anyone that a rider who can keep a smartly attired appearance is the one who has the least trouble with his machine, presuming he is clean and smart at the start. Trouble with belts, tyres, engines, etc., usually means a dirty appearance at the end of a day's ride unless one has time to stop for the necessary ablutions. As far as the machines are concerned, marks will be awarded for their general condition during and after the trial.

The 'passenger class' was disappointing. This was only to be expected. There are so few people making a good passenger motor cycle that the trade entries were naturally small. A passenger machine of the motor cycle class also has to be of the very best description to enable it to successfully complete a lengthy trial of this nature, and, of course, it would be perfectly ridiculous to enter with the knowledge that the risk of failure was great, for the simple reason that failure in the trials is a very bad advertisement. However, the day of the motor cycle passenger machine will eventually come. What form it will take it is impossible to say, but the advantages are too great for this type to be discarded.

Competitors seem to have had the usual trouble with tyres and belts. Curiously enough, the belt troubles seem to have been suffered on the first day. This is probably accounted for by the fact that inexperienced riders would start with a brand new belt which had not been stretched, and they would be dismounting two or three times during the day to take up the slackness. A 1,000 miles competitor should start with a

stretched belt, and a spare on the machine which has also been stretched, but experience can only be gained in actual competition. The sealing of the machines was efficiently carried out by the officials in charge of the Trials, but we think they might have improved on the method of sealing the engine. In many instances the wire was placed round the base of the cylinder and sealed. Now this does not prevent removal of the cylinder and the replacement of the piston, gudgeon pin, or other parts, such as rings, whereas if the cylinder had been sealed to the frame it would have been impossible to remove it without breaking the seal. It is a great pity that the climb up Birdlip Hill could not be officially timed. We know the reason why it was not, viz., because the use of the hill has been abused in the past, and the authorities now refuse to allow anything in the nature of a competition on it.

Saturday being the last day of the Trials was naturally the day when the machines were somewhat out of tune, having covered approximately 950 miles, therefore a timed performance on a hill like Birdlip at the conclusion of 950 miles would have been even more valuable than the other timed climbs.

Taking everything into consideration, the Trials have been a huge success. The entries were large, and as far as we can make out the competitors were satisfied except, of course, those who failed to survive the Trials. They must accept the fortune of war and prepare for better things in 1910. The experience gained in 1909 will no doubt be of considerable help to them, and we venture to say that not one single competitor or firm who has taken part will have failed to gain some valuable information from the 1,000 Miles Trials ridden under official observation.

A Simple Change Speed Gear.

OUR French contemporary *La Vie Automobile* prophesies that the tricar type of vehicle will eventually be reborn, and illustrates in a recent issue a system of change speed gear for tricars which will interest readers of *The Motor Cycle*.

Reference to the illustration shows that the engine-shaft B is fitted with an outside flywheel C, whose function is not only to increase the regular running of the engine, but has to do also with the change speed device. Cast with the flywheel is a recess D, in which revolves a ball bearing E carrying a square shaft F. This shaft is supported at the end G by a bearing which can be fitted to any convenient part of the tricar frame.

obtained with a direct drive. A pedal J moving around a centre K causes the fork L to withdraw the internal portion of clutch by bearing against the ball thrust bearing M, and so compressing the spring.

The above refers to the high or normal gear and free engine. We now come to the device for obtaining a low speed gear for hill-climbing, etc.

Fixed on the shaft K are two short levers N carrying a pair of friction wheels O and P of different diameters. These wheels are keyed to a shaft Q, and the shaft is provided with ball bearings S S, the bearings being surrounded by a cage R, on which is cast a lug carrying a transverse shaft T, which also connects up to suitable holes in the levers N. The cage R carrying the axle Q, etc., is therefore compelled to follow any movement of the pedal J. Suitable arrangement of parts is made, so that an increased leverage is obtained when the pedal is depressed.

We now come to the method of operation, and it will be as well to observe at this juncture that the pedal J can be just as easily replaced by a hand lever if desired.

To start the machine it is generally advisable to apply the low speed gear, and in case of the gear under review all that is necessary is to depress the pedal, which movement will bring the low speed into operation. The two levers N will simultaneously cause the friction wheels O and P to bear with more or less pressure on two cylindrical parts—one a portion of the flywheel C and the other of the cone H. The gear is so made that when the friction wheel P bears on the cone H the latter is just withdrawn sufficiently to come right underneath the wheel and register with it, or if desired the wheel can be made wider than the cylindrical part of clutch, so that it always engages with it, no matter what position the clutch may be in. Friction wheel O and cylindrical part of clutch U are leather faced. It will be noticed that when the friction wheels are in engagement with the respective surfaces against which they bear the engine is driving the friction wheel O, and P is driving the shaft on which is fixed the chain wheel, belt pulley, or gear wheel which is driving the tricar.

The only fault that we can see in connection with the gear is that there does not appear to be any arrangement made for enclosing the friction wheels, but this, of course, is quite easy.

A friction cone H is free to slide on the squared shaft F, and can be caused to bear more or less strongly against the external part of the clutch cast on the flywheel. When the two portions internal and external of this clutch are engaged the high speed is

CURRENT CHAT.

THE A.C.U. SIX DAYS' RELIABILITY TRIALS

Copiously Illustrated Description.

TIME TO LIGHT LAMPS.—July 14 .. 9.10 p.m. July 17 - 9.8 p.m. July 21 .. 9.3 p.m.

R.A.C. Provincial Meeting in Warwickshire, July 24.

On the occasion of the Royal Automobile Club's provincial meeting in Warwickshire, on Saturday, the 24th inst., a number of motor cycle works will be open for inspection in Coventry.

Police Traps.

An Oxford motorist was fined £10 and costs for exceeding the legal limit on Sunrising Hill, between Banbury and Stratford-on-Avon.

On main road from Leeds to Bradford, beginning at Bramley Station, distance 440 yards. Unfair methods are employed for trapping, as a policeman walks alongside a passing vehicle and waves his handkerchief to begin timing. Obviously, the car, or motor cycle, will already have travelled some distance before the signal is made.

Hill Climbs in N.S.W.

The Motor Cycle Club of New South Wales held a hill-climb on May 29th on Baden Hill, Coogee. Contestants numbered twelve, and competed in pairs, winners meeting winners. In the final A. J. Powell's 3½ h.p. L.M.C., the same owner's 2¼ J.A.P., and H. K. Eaton's 5 h.p. Peugeot met and finished in that order.

Imports of Motor Cycles.

Imports of motor cycles during June were 187 complete machines (valued at £5,413) and £1,951 worth of parts, total £7,364, as compared with £6,424 in June, 1908, and £8,031 in the corresponding month of 1907. The import figures for the six months ended 30th June were:

1907.	1908.	1909.
£49,637	£36,207	£35,360

Exports of British Motor Cycles.

Ninety-five British-made machines were exported last month (value £3,293) and £2,258 worth of parts, total £5,551, compared with £2,839 in June, 1908, and £2,508 in the corresponding month of the previous year. The value of our exports during the six months ended 30th June was:

1907.	1908.	1909.
£26,132	£24,485	£36,336

It will be seen from the above that British exports have caught up, and are now well ahead of the import figures.

Re-exports of Foreign Motor Cycles.

Foreign made motor cycles have been re-exported from this country to the value of £1,451 during the first six months of 1909, together with £8,075 worth of parts—£9,526 in all.

Mr. Lloyd George and the Motor Taxes.

It is considered that the deputations from the Motor Union to the Chancellor of the Exchequer have advanced the discussion on the motor taxes considerably. The Chancellor has given expressions of his opinions amounting almost to assurances on the following points: (1.) That an Advisory Committee, on which motorists shall be represented, will be associated with the Central Authority in the distribution of the Road Grant. (2.) That the Road Grant shall be devoted to the improvement of the roads as distinguished from maintenance. (3.) That he will consider the possibility of making arrangements to exempt foreign, colonial, and Indian visitors to this country from the car tax. (4.) That doctors shall have a rebate of fifty per cent. on the petrol tax.

From Cape Town to Johannesburg.

Mr. J. Hegarty, a well-known motor cyclist in the Cape Peninsula, is depicted in the accompanying illustration on his 3½ h.p. 1908 Phelon and Moore. This rider is shortly to attempt the journey to Johannesburg, about 1,000 miles distant from Cape Town. His trip is sure to be an adventurous one, as we are told the roads are in a terrible state after heavy rains. None of the rivers, except the very large ones, have bridges, and the roads, or rather cart tracks, having never been made, are a mass of washaways. The machine he will use on this ride is an 8-9 h.p. m.o.v. 1909 Bat, with Phelon and Moore two-speed gear and combined belt and chain transmission.

venturous one, as we are told the roads are in a terrible state after heavy rains. None of the rivers, except the very large ones, have bridges, and the roads, or rather cart tracks, having never been made, are a mass of washaways. The machine he will use on this ride is an 8-9 h.p. m.o.v. 1909 Bat, with Phelon and Moore two-speed gear and combined belt and chain transmission.

The Bradford Open Hill-climb on Saturday.

The Steep, Denholme, the venue of the Bradford M.C.C. open hill-climb next Saturday, appears, from photographs kindly sent to us by Mr. H. Somers, to be an ideal hill for a competition. There are two gradual bends—one near the starting post, the other near the finishing post. There is a low wall at each side of the road, so that spectators will be able to see the competitors during the greater part of the climb.

The Tourist Trophy Race in the Isle of Man.

Mr. Straight, secretary of the Auto Cycle Union, informed us one day last week that the Committee has definitely decided upon a date for the Motor Cycle Tourist Trophy Race in the Isle of Man. The date fixed is Thursday, September 23rd. This year's race will be more interesting, if anything, than any previous T.T., as single and twin-cylinder machines race together in competition for the trophy. Full details will be announced in a subsequent issue.

A.C.U. Quarterly Trials.

The next Quarterly Trials will take place on Wednesday, July 28th, over the usual course—Uxbridge to Banbury and back. Entries can now be accepted, and should be addressed to the secretary, the Auto Cycle Union, 18, Down Street, Piccadilly, W. The Quarterly Trials are a splendid advertisement for any private owner who wishes to dispose of his mount, as the A.C.U. certificate is a guarantee that the machine is in perfect running order.

New York M.C.C. Hill Climb.

The New York Motor Cycle Club's seventh annual hill-climb was not the success anticipated. It appears that American motor cyclists have hitherto regarded rules more in the light of unnecessary formalities, and although engines with bottom exhaustholes were barred according to the rules, a number of competitors attempted to use engines of this type. The referee naturally disqualified them all, but it led to much wrangling, and delayed the start of the competition two hours. Two riders carried off all the honours, Classes A and B being won by Fred Voelker (3 h.p. twin N.S.U.), the remaining four being won by Walter Goerke (Indian). The first place of all the competitors on Professor Callendar's formula was also secured by Fred Voelker.

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

A Stoppage of the Petrol Supply.

? I wonder if you could account for my motor cycle refusing to take air. It is a 1909 Triumph, and I have covered about 3,000 miles on it, and only recently I found that it wouldn't fire properly unless I practically closed the air lever, so I took off the cylinder and cleaned away the carbon deposit. I also took the carburetter to pieces and cleaned it thoroughly, but still it refused to take as much air as formerly, consequently the speed is very much reduced.—W.L.G.

It is difficult to account for your machine taking less air unless the jet or petrol pipe are partially stopped up. We should, however, recommend you to verify this carefully. A further reason may be owing to the gauze in the carburetter being choked with dust.

Tyres and Starting by Pushing.

? (1.) I have a 6 h.p. N.S.U. and sidecar, and find I wear the back tyre and the sidecar tyre out in 500 miles. This is too heavy for my pocket, so would it be possible to have a solid rubber tyre on the back wheel? I do not want to go faster than twenty miles per hour. If not, what sort of tyre is the hardest wearing? (2.) I have often seen in *The Motor Cycle* that to start a machine with or without a passenger is easy if you have a speed gear, as you only have to push it along at four miles an hour on the low gear, and drop the exhaust and it starts. If I push mine along at eight miles per hour and drop the exhaust the back wheel only skids, being unable to overcome the compression. I have to jack mine up, start by the pedals, then turn to free engine, lower jack, get on, and then engage the low gear—a laborious task, especially in traffic. An article on how to start passenger machines would be interesting.—F. W.

(1.) It would not be satisfactory to fit a solid tyre upon your motor bicycle. It would jolt the spokes out in a very few miles, and would be most uncomfortable. The best thing you can do is to fit tyres proportionate to the work they are called upon to do. Heavy motor cycle tyres would be satisfactory, and would overcome your

trouble, though it would naturally entail extra initial expense. (2.) There is a knack in starting by pushing on the low gear. With high compression engines it is not advisable to release the valve lifter suddenly, as this causes the back wheel to skid, but let it down gradually so that some of the compression can escape. If you practise this a few times you should be able to start without skidding the back wheel, although, of course, everything must be properly adjusted for easy starting. We are afraid with your particular gear there is no alternative but to jack up the machine to start it, and then put the gear in neutral.

A Route from the Midlands to Brighton Avoiding London.

? I am wanting to go from Tuxford to Brighton by road (avoiding London). Will you please give me the best route? —B.G.

Your best route will be as follows: Tuxford, Newark (beware of traps between Long Bennington and Great Gonerby and Colsterworth and Ponton, on each side of Grantham), Stamford, Stilton, Biggleswade, Baldock, Stevenage, Welwyn, Hatfield; here turn to left and go through St. Albans, Watford, Rickmansworth, Uxbridge, Colnbrook, Staines, Shepperton, Esher, Cobham, Leatherhead, Dorking, Reigate, Crawley, Hand Cross (beware of traps), Piecombe, and Brighton.

A. D. Draper, a competitor in the Six Days' Trials. The motor cycle—a 3½ h.p. Matchless-J.A.P.—was built with A. M. Tatham's in 1907 and both had covered upwards of 10,000 miles at the start of the trial.

A Loss of Compression.]

? I have a 3½ h.p. Rover engine. Compression is very bad, but on turning the pulley backwards it is very good. The gas escapes with a hissing noise, but I cannot trace where. You can perhaps help me. The rings have been in use about 200 miles, and on examining I find them bright all over.—A. A.

You need not take any notice of the compression when the machine is wheeled backwards. All you have to concern yourself about is the compression with the engine rotating in the proper direction, and if this is not good you must look for the loss of compression past the valve caps, unless, of course, the machine is fitted with a compression tap and this is not gastight. If you are convinced that all joints are tight, we should suspect a crack in the cylinder.

Slow Running. Carburetter Flooding.

? (1.) I have a 6 h.p. twin bicycle and sidecar, magneto ignition, automatic inlet valves, and I find I cannot keep the speed down under fourteen or fifteen miles an hour. I have tried shutting off the bottom air which only makes the engine run badly. I should be glad if you would tell me how to run at about seven or eight miles, without losing power for hills? (2.) The points of my contact breaker separate about one-eighth of an inch at their fullest. Would this make any difference? The only way to remedy this, I suppose, would be to cut or file the fibre ring. (3.) My carburetter floods slightly. How is it possible to judge the right level, for when the carburetter is disconnected you naturally lose the exact position or angle it is when on the engine? What do you mean by a dummy jet?—B.B.

(1.) Probably the inlet valve springs are too strong, though it would be a pity to alter these if the machine starts easily and runs well in other respects. Weak springs enable easy starting and slow running. A strong mixture will prevent the engine running slowly, so if the consumption is excessive try a smaller jet. (2.) Before touching the magneto we should advise you to put your troubles before the Bosch Com-

pany, as they will be glad to help you. One eighth inch is certainly too much break at the contact points. We do not advise filing or cutting anything before consulting them. (3.) A dummy jet is really a pipe slipped over an old jet cut down, or the boss on which the jet screws, which is wide enough to allow the level of the petrol to be seen. As your carburetter floods, it proves that there is either a leak somewhere or the level of the petrol is too high. The needle valve requires grinding in occasionally.

Attention to Leather Belts.

? Might I ask for full and detailed instructions as to dressing new leather belts, and the methods used to keep the same supple and in order,

such belts as Rawido, etc.?—DR. R. A new leather belt is usually properly dressed to begin with, but if it shows signs of being very hard and dry it would be as well to rub Collan oil (obtainable from A. W. Gamage, Holborn, E.C.) into it with a soft rag, and then hang it up for a couple of days with a fairly heavy weight at the end of it. This should take out the initial stretch. To keep a leather belt in good order it should be periodically scraped with an old knife so that all particles of grit are removed from it, after which it should be again dressed with Collan oil.

Various Interesting Queries.

? (1.) I have a 1907 2½ h.p. Minerva motor bicycle which has run about 1,500 miles. When I push it along before mounting I hear a sort of thumping in the cylinder, which, however, disappears after it has run a short distance. Should this be the case, or is it what is called knocking? The engine has not been dismantled since I had it. (2.) I always drive it with full air open, and find that it goes much more powerfully like this on a cold damp day than on a warm bright day. Does this mean that I should supply more air in the latter case, or is it simply that the engine is cooled more by the draught on a dull day? (3.) I have always driven the bicycle in my ignorance with the throttle full open. This I find is a mistake, having now read "Motor Cycles and how to Manage Them." I find the engine not nearly so powerful as it should be, and nearly stops on some absurdly slight gradient. Is this the result of my Jehu-like driving? The exhaust valve is slightly pitted; would a new valve improve the power? I cannot test the compression by standing on the pedals as there are none, there being a Roc two-speed gear fitted. If I had the engine dismantled and the piston cleaned and valve seen to, would there be much difference in power? (4.) How fast should I be able to travel on this machine, and what is the steepest gradient it should take on the high gear?—H. F. M. B.

(1.) Probably the noise is the suction of the piston and the clattering of the valve. A rumbling noise is caused by

worn bearings. (2.) This seems to be simply a question of carburation, and it would appear that better results would be obtained by increasing the air supply. (3.) Naturally, the machine is not so powerful with the throttle closed. What you should do is to keep the throttle partially closed and the spark advanced on the level, and open the throttle when you come to a hill or want to go fast for a short stretch. The exhaust valve can probably be ground in, and a new one will not be necessary. Do not have the engine dismantled unless it has fallen off greatly in power. You can test the compression by pushing the machine along with the valve lifter released. If the compression cannot be overcome and the back wheel is skidded, the compressor cannot be very poor. (4.)

hot through conduction; it is only when the crankcase gets excessively hot that leakage past the rings should be suspected.

Compression and Suction.

? My 1907 3½ h.p. Rex motor cycle losing power and speed led me to make an examination. Among other things, I noticed that it has practically two compressions. In addition to the ordinary one there appears to be another one on the down or power stroke, almost as tight as the proper up compression stroke. It immediately disappears on opening the compression tap. It is not pressure in crankcase, as it happens with relief valve taken out altogether. Surely this is not as it

A.C.U. Six Days' Trials. F. C. Mustard (3½ h.p. Triumph) climbing Dinas Mawddwy in the rain and against a head wind. This climb is extremely severe at the best of times, but the rain and wind accounted for many failures.

You should be able to reach forty miles an hour with this machine on level ground comfortably, and climb 1 in 9 on the high gear, if your weight is not above the average.

Position of Magneto. Heat of Crankcase.

? (1.) Is it detrimental for the field magnet of Bosch magneto to be touching base of cylinder? (2.) The crankcase of my 2½ h.p. Rex featherweight gets very hot after a journey of about six miles, and this although the compression is very good and will stand my weight (ten stones) on pedal. Can you give any explanation for this?—M. 1044.

(1.) There is no actual harm in the magnets touching any other part of the machine except that excessive vibration may tend eventually to destroy the magnetism. (2.) We should say that your crankcase gets

should be, and I feel sure it is the cause of my losing power and speed. Caps, valves, and plug all in good order, compression good when warm.—J. H. H.

What you imagine is the second compression is really suction. You can test this for yourself by opening the compression tap of the engine and holding your finger over the hole. When the engine is on compression there will be a tendency for your finger to be blown away, but on the "second compression" you mention there will be a distinct sucking action.

The 1d. Edition of "The Autocar."

Readers of "The Motor Cycle" who are interested in motor cars are reminded that a Penny Edition of "The Autocar" is now obtainable of all Newsagents and Booksellers every Friday Morning, in addition to the 3d. issue.

First Day.—London to Shrewsbury via Oxford and Worcester. 143½ miles.

AS stated in last week's issue, all the entrants started with one exception. The names of those who left Uxbridge on Monday of last week, and the machines they rode, are given hereunder:

No.	Rider and machine.	No. of cyl.	Bore and stroke. mm. mm.
*1.	W. H. Outwin (3½ h.p. Triumph)	1	84 × 86
*2.	E. Nelson (5 h.p. Rex)	2	76 × 80
*3.	A. D. Draper (3½ h.p. Matchless)	1	85 × 76
*4.	A. M. Tatham (3½ h.p. Matchless)	1	85 × 76
*5.	C. Williams (3½ h.p. Triumph)	1	84 × 86
*6.	G. H. Lake (3½ h.p. Triumph)	1	84 × 86
7.	W. W. Douglas (2¾ h.p. Douglas)	2	60 × 60
8.	J. V. Robinson (2¾ h.p. Douglas)	2	60 × 60
9.	P. Phillips (2¾ h.p. Douglas)	2	60 × 60
*10.	F. Dover (3½ h.p. Triumph)	1	84 × 86
*11.	W. O. Bentley (3½ h.p. Rex)	1	82 × 89

*Private owners.

H. G. Cove, one of the judges, affixing the seals to a competitor's machine before the start.

The teams competing for the team prize are: Douglas (Messrs. Douglas, Robinson, and Phillips), Phelon and Moore (Messrs. Pratt, Moore, and Milnes), Bat (Messrs. Bowen, Fenn, and Tessier), Rex (Messrs. Sproston, Lord, and Godfrey), Humber (Messrs. Crundall, Edmond, and Sumner), Triumph (Messrs. Newsome, Marshall, and Gordon Gibson), Premier (Messrs. Teage, Stanley, and Walker), Platt, Eastwood, and Stanton).

The Six Days' Reliability Trials.—

The day certainly began well. It was fine and sunny, and there was little or no wind. As far as Wheatley, six miles from Oxford, the well-known Quarterly Trials' route was followed, and consequently this particular section of the road was familiar to many of the competitors. Outside Uxbridge many of the men were seen in temporary trouble by the roadside, some suffering tyre and others belt troubles, among whom was Tessier, who at Gerrard's Cross lost a bundle off his luggage-carrier, and then had a puncture. In Wycombe F. Dover ($3\frac{1}{2}$ h.p. Triumph) had a whole series of tyre troubles, which lost him many marks. At Dashwood, up which the little 10 h.p. Delage placed at my disposal carried me in excellent form, Mr. J. R. Nisbet arrived with his 30 h.p. Humber car bearing several of the officials, while shortly after came a 20 h.p. Rover with other officials on board. Nearly all the machines successfully conquered the famous hill, but H. Bevir ($3\frac{1}{2}$ h.p. L.M.C.), a rider of a Moto-Rêve, and other lightweight riders pedalled. Seen from the summit, a huge batch of motor cyclists climbing in close order presented an interesting spectacle.

The Oxfordshire roads were only in fair condition, and in places steam rollers were at work effecting tardy

Near Enstone several stiff hills had to be negotiated, but beyond the third check, Chipping Norton (outside which a good many riders had to wait through being too early), the hills became more severe. The district was then entered where the villages have treble-barrelled names, such as Moreton-in-the-Marsh, and near it Stow-on-the-Wold and Bourton-on-the-Hill. The latter is certainly well named, as more than one rider found the ascent none too easy. The lightweight Wolf failed to make the ascent through a slipping belt, and later in the day the magneto-shaft almost seized.

The road surface for about the third of the way down Fish Hill, Broadway (which was the scene of a hill-climb two years ago), was perfectly execrable, and almost unsafe, but happily it improved lower down. In Worcestershire the roads were very much better, and

Four of the five riders of 1909 Bradburys in last week's trials. The team representatives were Platt, Eastwood, and Stanton.

The Triumph team in the Six Days' Trials—Marshall, Newsome, and Gibson.

repairs and considerably hampering the riders. At Tetsworth, R. W. Walker ($3\frac{1}{2}$ h.p. Premier) had a short circuit in his magneto, and in Oxford met further misfortune, being thrown from his machine by a dog on Magdalen Bridge. Oxford did not look its best, as both Queen's and Christ Church were covered by scaffoldings. Leaving the dear old university city by the Woodstock Road, the going varied considerably. At times the surface was smooth, then a steam roller was encountered, and for a time the surface was shockingly worn. In fact, it is not too much to say that the Oxfordshire roads are not well enough kept for the increase in traffic they now have to stand. The repairs done are good so far as they go, but they are not sufficiently extensive.

a good run was made to the county town, where a stop was made for lunch. Here Phillips's $3\frac{1}{2}$ h.p. Scott, which had been the centre of attraction since the start, suffered a series of punctures from a nail, and Dixon's Vindoc was in a similar plight owing to the canvas having gone inside his brand new front cover. The ninety-five miles run from Uxbridge to Worcester made the men only too ready for lunch, but afterwards on good roads they felt better, and made a comfortable journey to Kidderminster.

After leaving this town a series of steep hills were encountered, on which many spectators assembled to watch the fun. The gradients, however, though trying, were by no means insurmountable. Bridgnorth—that curiously picturesque town built on a rock—was then passed, and after the ascent and descent of Wenlock Edge, an easy run was made to Shrewsbury, the destination for the day, and the centre from which the succeeding days' run are to be made. The western slope of Wenlock Edge, from which a fine view of the Wrekin is first seen, is marked "Danger (1 in 6)," and it is up this hill that the men were to climb next day. A heavy shower, fortunately of brief duration, was experienced beyond Bridgnorth, which happily did no more than lay the dust. Otherwise the weather was excellent. All the officials are covering the course on cars, except

The Six Days' Reliability Trials.—

Reynolds, who is mounted on a $3\frac{1}{2}$ h.p. two-speed Humber.

Of the seventy-four starters whose names have been mentioned, only one—Ormerod ($3\frac{1}{2}$ h.p. Scott)—has failed to arrive. Several of the riders complained of nails being strewn on the road near Shrewsbury. Those picked up were new, and consequently people are unwillingly inclined to be suspicious. The following, besides those mentioned above, suffered troubles: R. Lord (5 h.p. Rex), tyres; P. E. Tolfree (5 h.p. Roc and sidecar), loose exhaust pipe union; F. C. Boddington ($3\frac{1}{2}$ h.p. Rex), repaired petrol pipe; and H. B. Lewis ($3\frac{1}{2}$ h.p. Triumph), tyres.

The team of Humber motor bicycle riders. Crundall, Edmonds, and Sumner competed for the Team Prize.

On their arrival in Shrewsbury the machines were carefully stored in Mr. H. Luff-Smith's commodious garage, in a portion specially set apart for them. The first day's run has certainly been successful, and most of the men appear to have enjoyed the run thoroughly. The journey for the day has been over average English roads, and much the same sort of country will be traversed to-morrow. On the third and fourth days, however, matters will be quite different.

In addition to the troubles mentioned previously, one of the Bradburys had its engine almost seize up owing to bad oil, but the rider was fortunately able to free it. The following lost marks on the day's run: F. Dover ($3\frac{1}{2}$ h.p. Triumph), ran hairpin in tyre (the spare tube he was carrying did not fit, and he had to return to Wycombe to get another, and so lost two hours), 116 marks; R. W. Walker ($3\frac{1}{2}$ h.p. Premier), short circuit and fall in Oxford, 34 marks; A. H. Ormerod ($3\frac{1}{2}$ h.p. Scott), retired (reported through tyre troubles); A. G. Fenn (6-7 h.p. Bat), late at control through belt trouble, 7m.; A. T. Stanton ($3\frac{1}{2}$ h.p. Bradbury), trouble not stated, 78m.; A. Baker ($1\frac{1}{2}$ h.p. Wolf), belt and tyre troubles, 173m.; A. L. Ommaney (5 h.p. Rex), trouble not stated.

The following lost no marks: W. H. Outwin ($3\frac{1}{2}$ h.p. Triumph), E. Nelson (5 h.p. Rex), A. D. Draper ($3\frac{1}{2}$

h.p. Matchless), A. M. Tatham ($3\frac{1}{2}$ h.p. Matchless), C. Williams ($3\frac{1}{2}$ h.p. Triumph), G. H. Lake ($3\frac{1}{2}$ h.p. Triumph), W. Douglas ($2\frac{3}{4}$ h.p. Douglas), J. V. Robinson ($2\frac{3}{4}$ h.p. Douglas), P. Phillips ($2\frac{3}{4}$ h.p. Douglas), W. O. Bentley ($3\frac{1}{2}$ h.p. Rex), F. G. Boddington ($3\frac{1}{2}$ h.p. Rex), B. H. Davies (6 h.p. Advance), H. Bevir ($3\frac{1}{2}$ h.p. L.M.C.), W. H. Wells (5 h.p. Indian), G. Lee-Evans (5 h.p. Indian), R. Moore, W. Pratt, W. Milnes, and T. Canby ($3\frac{1}{2}$ h.p. P. and M.'s), R. M. Brice ($3\frac{1}{2}$ h.p. Brown), J. Slaughter and J. T. Bashal ($3\frac{1}{2}$ h.p. Triumphs), W. H. Bashall (6-7 h.p. Bat), T. H. Tessier (7 h.p. Bat), W. Smith, G. L. Fletcher, and G. L. Andrews (2 h.p. Moto-Rêves), A. J. Sproston and R. Lord (5 h.p. Rexes), O. C. Godfrey ($3\frac{1}{2}$ h.p. Rex), F. Phillips ($3\frac{1}{2}$ h.p. Scott), F. Southam, R. W. Duke, and F. C. Mustard ($3\frac{1}{2}$ h.p. Triumphs), J. O. M. Dixon (5 h.p. Vindec), J. Holroyd ($1\frac{1}{4}$ h.p. Motosacoche), J. F. Crundall, F. Edmond, A. V. Sumner, and O. Parker ($3\frac{1}{2}$ h.p. Humbers), F. C. Wood (4 h.p. N.S.U.), W. F. Newsome, J. Marshall, and Gordon Gibson ($3\frac{1}{2}$ h.p. Triumphs), H. Berwick ($3\frac{1}{2}$ h.p. Excelsior), H. D. Teage and G. E. Stanley ($3\frac{1}{2}$ h.p. Premiers), A. Weatherilt ($3\frac{1}{2}$ h.p. Zenette Gradua), F. W. Barnes ($3\frac{1}{2}$ h.p. Zenette Gradua), J. W. Morris, G. Simpson, P. Platt, and J. Eastwood ($3\frac{1}{2}$ h.p. Bradburys), G. E. Carrow, R. King, and F. S. Barnwell

The four competitors on Premier motor cycles—three single cylinders and one twin. The three riders on the right—Stanley, Walker, and Teage—composed the Premier team.

($3\frac{1}{2}$ h.p. Triumphs), T. Woodham (7 h.p. V.S.), S. Osborne ($3\frac{1}{2}$ h.p. Osborne), H. B. Lewis ($3\frac{1}{2}$ h.p. Triumph), R. Fletcher ($3\frac{1}{2}$ h.p. Premier), Rev. B. Aston ($3\frac{1}{2}$ h.p. Triumph), A. J. Stevens (3 h.p. Wolf), P. Tolfree (5 h.p. Roc and sidecar), J. Miller (4 h.p. Zenith Gradua and sidecar), and W. Pershke (6 h.p. Puch and sidecar).

Second Day.—Circular Tour from Shrewsbury via Wenlock, Stourbridge, Bromsgrove, Evesham, Tewkesbury, Ross, Ludlow, and back to Shrewsbury. 173½ miles.

The first machines were booked out at 8 a.m. from Mr. Luff-Smith's garage. The morning was fine, and the roads, with the dust laid by the previous night's rain, were in first-class condition. As far as the foot

The Six Days' Reliability Trials.—

of Wenlock Edge the route was practically level, and for the most part pretty fast, with the result that most people hurried along to the foot of this severe hill and then stopped, either to cool their engines or alter their

Climbing Much Wenlock Hill, 12½ miles from Shrewsbury, on the morning of the second day's run. The gradient at the steepest part is 1 in 6.

variable pulleys. The surface of the road over Wenlock Edge—which has two sections of about 1 in 6—was magnificent, but in spite of this there were a few failures. The performances on this hill do not in any way count officially, but in my opinion it is a pity they do not, as every machine which did not make the ascent satisfactorily should not qualify for a gold medal. Still, it must be first seen how the Cat and Fiddle Hill compares with Wenlock. A short account of the performances from personal observations may be of interest, showing as it does how the machines are behaving in this the early part of the week.

Very good ascents were made by C. Williams (3½ h.p. Triumph); W. Douglas and P. Phillips (3½ h.p. Douglas) pedalled slightly; W. O. Bentley (3½ h.p. Rex), G. Lee-Evans and W. H. Wells (5 h.p. Indians), H. Bowen (6-7 h.p. Bat), A. M. Tatham (3½ h.p. Matchless), A. D. Draper (3½ h.p. Matchless), A. G. Fenn and T. H. Tessier (6-7 h.p. Bats), F. C. Mustard (3½ h.p. Triumph), F. Phillips (3½ h.p. Scott), W. Milnes, R. Moore, and W. Pratt (3½ h.p. P. and M., on low gear). B. H. Davies (5 h.p. Advance) passed me in good style, but some way up the hill he dismounted to change his belt and alter his adjustable pulley. C. H. Lake (3½ h.p. Triumph), F. Dover (3½ h.p. Triumph), A. L. Ommaney (5 h.p. Rex), W. H. Bashall (6-7 h.p. Bat), travelled very fast; Smith and Fletcher (2 h.p. Moto-Rêves) pedalled slightly; H. D. Teage (3¾ h.p. Premier), F. S. Barnwell (3½

h.p. Triumph), G. L. Andrews (2 h.p. Moto-Rêve), G. Gibson (3½ h.p. Triumph), G. E. Stanley (3½ h.p. Premier), J. F. Crundall (3½ h.p. Humber), J. Marshall (3½ h.p. Triumph); A. V. Sumner (3½ h.p. Humber), F. W. Barnes (3½ h.p. Zenith), F. Edmond (3½ h.p. Humber), S. Osborne (3½ h.p. Osborne), W. F. Newsome (3½ h.p. Triumph), G. E. Carrow (3½ h.p. T.T. Triumph), P. Platt (3½ h.p. Bradbury), J. W. Morris (3½ h.p. Bradbury); B. Aston (3½ h.p. Triumph), T. Woodman (7 h.p. V.S.), R. W. Walker (3½ h.p. Premier), R. W. Duke (3½ h.p. Triumph), A. J. Sproston (5 h.p. Rex), O. C. Godfrey (3½ h.p. Rex), A. Baker (1½ h.p. Wolf), pedalled slightly; and W. Pershke (6 h.p. Puch and sidecar).

Of the less fortunate riders, E. Nelson (5 h.p. Rex), W. H. Outwin (3½ h.p. Triumph), J. V. Robinson (overalls caught in and broke advance spark lever), J. T. Bashall (3½ h.p. Triumph), F. G. Boddington (3½ h.p. Rex), J. O. M. Dixon (5 h.p. Vindec), J. Holroyd (1¼ h.p. Motosacoche), H. Bevir (3½ h.p. L.M.C.), P. J. Evans (3½ h.p. Humber), J. Miller (3½ h.p. Zenith and sidecar), R. King (3½ h.p. Triumph), P. E. Tolfree (5 h.p. Roc and sidecar), and A. J. Stevens (3 h.p. Wolf), dismounted. R. M. Brice (3½ h.p. Brown) and R. King (3½ h.p. Triumph) were among those who pedalled; while the engines of J. Eastwood's 3½ h.p. Bradbury and F. Fletcher's 3½ h.p. Premier knocked rather badly. Several machines failed almost at the top of the hill. Much interest was taken in the ascent by the spectators assembled on the summit.

Leaving Much Wenlock, the men followed the outward route covered yesterday to Bridgnorth, and after leaving this town the road to Stourbridge was covered.

Passing through Ludlow on the afternoon of the second day. The archway being narrow rendered this rise a slow hill-climbing test. B. H. Davies (5 h.p. Advance) is leading the string.

Here the surface was somewhat bumpy, and several steep pitches were encountered. Bromsgrove, Evesham, Tewkesbury, and Ledbury were traversed, and then Ross was reached, where lunch was served. The lunch and attendance at the Swan Hotel were all that could

The Six Days' Reliability Trials.—

be desired, but a charge of 3d. garage for each machine was met with by righteous indignation on the part of the competitors, and their resentment at one time nearly assumed serious proportions. It then began to rain, and to save further unpleasantness the men paid and tried to look pleasant. All the way from Ross through Hereford to the foot of Dinmore Hill the rain pelted down, but fortunately the roads were not exceptionally greasy, and through Herefordshire their surface was splendid. On the summit of Dinmore the rain ceased,

W. Milnes and W. Pratt (Two-speed P. and M.'s) leaving Worcester after the luncheon stop on Tuesday.

and the going became more pleasant. The hill is beautifully graded, and the climb presented no difficulties. Many of the men had to shorten their belts owing to the rain.

The check at Leominster was by no means clearly marked, and Draper and Bentley missed it altogether. At the level crossing outside the town several men were delayed through the gates being closed. Ludlow was then reached. It is a picturesque town, which is entered by a narrow archway (situated half-way up a steep hill), which allows only one vehicle to pass through at a time. About 5.30 another sharp shower was experienced. After an exceedingly pretty run through Church Stretton, Shrewsbury was reached at about 7 p.m. Great interest is being taken in the trial here, and many of the inhabitants turned out to see the men come in. The police have been of the greatest possible assistance in all the counties traversed. All those who started this morning have reached here by 11 p.m., except Nelson, who suffered inlet valve trouble, and Stanton, who is reported to have retired. Among to-day's unfortunates are Dixon, Wells, and Teage, who have suffered tyre troubles. Edmond (3½ h.p. Humber) was among those who had belt trouble; while the Roc and sidecar (carrying the only lady in the trial) has experienced a broken frame, which probably means its retirement.

Save for the retirements mentioned previously, and Osborne (3½ h.p. Osborne) 35m., and Baker (1½ h.p. Wolf) 98m., the performances on the second day's run were most satisfactory, as all the remainder lost no marks. Nelson appeared at Shrewsbury at 4 p.m. the next day, and after a brief interval started off again to complete the course.

Third Day.—Circular run [from Shrewsbury via Welshpool, Llanfair, Dinas, Mawddwy (hill climb), Cross Foxes, Machynlleth, Aberystwyth, Newtown, and back to Shrewsbury. 167½ miles.

To-day's run has been exceptionally arduous; not only has the course been most severe, but the elements have been far from kind. Seventy-one competitors started from Shrewsbury at 8 a.m. in fine but rather cold weather, and leaving the town by the Holyhead Road, bore left and continued to Welshpool and Llanfair Caereinion. Up to the latter village the surface was smooth and the gradients easy, but for some miles beyond the roads were bumpy and greasy after the heavy rain which had fallen in the night. From Pen-y-bont the route ascended over a well graded pass to an altitude of 832 feet, and then descended with few bad corners to Mallwyd, where a sharp turn to the right was made leading into Dinas Mawddwy. Instead of going into the village the left hand fork was taken, and a few miles further on the real climb began. The pass is certainly long, but the gradient does not strike one as being exceptionally severe. Still a strong wind blowing down the course made matters as bad as they could be, and, added to these adverse conditions, the tops of the mountains became covered in clouds, and rain soon began to fall heavily. The surface, however, was superb. All things considered, the machines behaved in a disappointing manner on the hill, which shows how necessary these trials are to show up the weak points.

The following is a record of the performances of the machines as they passed just below the bend before the summit is reached: A. M. Tatham (3½ h.p. Matchless) excellent; C. Williams (3½ h.p. Triumph) pedalled; A. D. Draper (3½ Matchless) dismounted, belt slipping; W. Douglas (2¾ h.p. Douglas) came up well till the last bend, and then dismounted; G. H. Lake (3½ h.p. Triumph) dismounted; P. Phillips (2¾ h.p. Douglas) dismounted; W. O. Bentley (3½ h.p. Rex) dismounted and ran; W. H. Wells (5 h.p. Indian) dismounted; G. L. Evans (5 h.p. Indian) dis-

Held up at a level-crossing near Leominster.

mounted; W. Pratt and W. Milnes (3½ h.p. Phelon and Moore) excellent; R. Moore (3½ h.p. Phelon and Moore) dismounted on corner; T. Canby (3½ h.p. P. and M.) dismounted and restarted; R. M. Brice (3½ h.p. Brown) pedalled vigorously, but got up; W. H. Bashall (6-7 h.p. Bat), A. G. Fenn (6-7 h.p. Bat), J. T. Bashall (3½ h.p. Triumph), H. H. Bowen (6-7 h.p. Bat), and T. H. Tessier (7-8 h.p. Bat) all

GAMAGES

FOR EVERYTHING FOR MOTOR CYCLING.

THE COWEY MOTOR CYCLE SPEED INDICATOR

Can be fitted to any machine, either spring or rigid forks. Will fit on either right or left hand side. Will register up to 60 miles per hour. Fully guaranteed. Price, with Odometer, £4 4 0. When ordering, please give the following particulars: Name of machine, h.p. of machine, size of front wheel, whether spring or solid forks. If spring forks, name of make.

"MATCHLESS" SPRING-FORK ATTACHMENT.

Converts an old pattern motor cycle into an up-to-date luxurious motor.

Thousands in use, giving every satisfaction.

15/6, Postage 6d.

"ROM" COMBINATION NON-SKID.

The tyre that gives absolute immunity from side slip under any road conditions. Exceptionally durable and very resilient. Equally serviceable for summer or winter use. No leather in its composition — which makes the tyre "dead" — yet practically unpuncturable.

OUR PRICES—

	Cover (Beaded.)	Rom Tube.
26 x 2	52/-	9/-
26 x 2 1/2	55/-	10/-
26 x 3	57/6	11/-
28 x 2	54/-	9/-
28 x 2 1/2	57/6	10/-
28 x 3	60/-	11/-

Wired-on Covers 1/- per cover less than above prices.

Butt Ended Tubes 2/- extra.

Motor Cycle Handle-bar Reflecting Mirrors.

The "Elastes" Motor Cycle Expanding Luggage Carrier.

Price in Leather, 10/6
In Fibre, 3/6

THE "TRIUMPH" MULTI-CYCLE HORN.

A new instrument of the multi twist style, but with trumpet forward.

Price 6/3. Post 3d.

THE "FANFARE" HORN.

New motor-cycle size. Loud, sharp, sweet note. Two-note, price 7/6. Second quality, 4/6. Best quality, three-note, 10/6. Post 3d.

The "Scenic" Motor Cycle Reflecting Mirror. 3-inch brilliant convex. Adjustable all ways. Fitted with locking nut. Price 4/11 Post 4d.

The "Kingston." Has convex 4-inch brilliant mirror with ball socket adjustment, with security fixing bolt. Very substantial. Price 5/11 Post 4d. See what is behind you, including police traps.

LYGETT'S TUBULAR CARRIER.

Price 6/6, including straps.

THE 1909 MOTOR CYCLE BAG.

With pockets for oil, plugs, and springs.

Price 7/6 Postage 3d.

THE COMPACT MOTOR CYCLE HORN.

Very deep and sonorous note, well made, good finish throughout in nickel. Price 8/6 large size, and 5/9 small. Postage 4d.

THE "TOTAL" CYCLOMETER.

Very strong and specially suitable for motor cycles.

Price 5/6

THE "ELECTARY" COMBINED TUBE AND BELT CARRIER.

Can be attached to top or side of luggage carrier. Price 9/6. Sunk pattern.

THE 'SHAMROCK' BELT PUNCH.

Price 1/6.

BOSCH MAGNETO REPAIR PARTS.

Full assortment always in stock.

"PATCHQUICK" PATCHES

thoroughly amalgamate with the tyres, and will neither creep nor come off when the tyres get hot. They require no Vulcaniser, are fixed in five minutes, and will expand when tyres are inflated.

Price 6d. and 1/- per tube. Patches 2d. each. Repair Outfits, 3/-. Car sizes, 5/9, 10/6. Can be sent by post or rail.

ROBBIALAC.

This famous enamel gives a result equal to STOVING — almost indestructible. Colours in stock—black, grey, blue, red. Any colour to order Tins 1/6.

The Six Days' Reliability Trials.—

came up in splendid form in quick succession; J. Slaughter (3½ h.p. Triumph) pedalled but got up; B. H. Davies (6 h.p. Advance) failed at corner through throttle jamming; F. Dover (3½ h.p. Triumph) failed at corner; W. Smith (2 h.p. Moto-Rêve) pedalled but got up successfully; F. C. Mustard (3½ h.p. Triumph) excellent; F. Southam (3½ h.p. Triumph) excellent; A. L. Ommaney (5 h.p. Rex) dismounted; R. W. Duke (3½ h.p. Triumph) pedalled but completed the ascent; F. G. Boddington (3½ h.p. Rex) dismounted; J. F. Crundall (3½ h.p. Humber) pedalled but got up; H. Bevir (3½ h.p. L.M.C.) pedalled vigorously but got up; F. C. Wood (4 h.p. N.S.U.) came up well on low gear; J. Holroyd (1¼ h.p. Motosacoche) pedalled but came up in excellent form; P. J. Evans (3½ h.p. Humber) pedalled hard but got up; G. E. Stanley (3½ h.p. Premier) dismounted; O. C. Godfrey

latter town by the shortest way, and, to my astonishment, met B. H. Davies with his tank empty walking towards Dinas Mawddwy, the reason being that he had been wrongly directed by a policeman. The remainder of the road into Aberystwyth was easy and the surface for the most part good, while the rain ceased. From Aberystwyth to the Devil's Bridge the road rises to a great height, and is level with the tops of the surrounding hills. In sections several of the men were seen in trouble. The Devil's Bridge Hotel, where the men had lunch, is beautifully situated, facing as it does a lovely gorge, in the centre of which is a splendid waterfall. From time to time heavy showers fell, but after lunch the going was for the most part good. Two miles from the bridge the road was badly marked, and at two road forks there was no indication of which was the route. One well-graded pass had to be climbed, and then for many miles was the

At the top of Dinas Mawddwy—the Welsh precipice—in the rain; a Motosacoche and a Humber in the foreground.

(3½ h.p. Rex) pedalled but got up; W. F. Newsome (3½ h.p. Triumph) stopped, waited, and then came up in good form; F. W. Barnes (3½ h.p. Zenith Gradua) excellent; J. Marshall (3½ h.p. Triumph) dismounted, restarted, and came up in good form; O. Parker (3½ h.p. Humber) dismounted; G. Gibson (3½ h.p. Triumph) dismounted; H. D. Teage (3½ h.p. Premier) dismounted; A. Weatherill (3½ h.p. Zenith Gradua) dismounted; P. Platt (3½ h.p. Bradbury) pedalled but got up; G. L. Andrews (2 h.p. Moto-Rêve) pedalled but got up in good form; H. Berwick (3½ h.p. Excelsior) pedalled but got up; and A. V. Sumner (3½ h.p. Humber) dismounted. Some dozen of the remainder failed to make the ascent, and the Rex and sidecar shed its passenger.

These are the majority of those who made the ascent. Though the rain was more than unpleasant, the hill-climb was a sight not to be missed. For nearly a mile the men could be seen coming up the long ascent amid splendid scenery. All the morning the country passed through had been delightful, but its beauty was marred by the drenching rain. Leaving the summit of the pass, the men proceeded to the Cross Foxes Inn, and then passed through Machynlleth. I, however, descended the hill and made for the

road downhill, and in most places in fine condition. Near Bishop's Bridge, which was a very difficult town to traverse, but very well marked, there were several stiff hills.

The following are stated officially to have climbed the Dinas Mawddwy test hill successfully: Nos. 4, 18, 20, 22 (p), 23, 24, 25, 26, 27, 28, 29 (p), 37 (p), 38 (p), 39, 41 (p), 43 (p), 56, and 70 (p). P signifies with pedal assistance.

Marks were lost by: P. J. Evans, 11; H. D. Teage, 11; Simpson, 189; Miller, 29; Outwin, 16 (kicked by a horse); Boddington, —; Ommaney, 10; Bevir, 7. The following retired yesterday: 55, Walker; 62, Stanton; 67, Osborne; 71, Baker; 73, Tolfree; 2, Nelson (running unofficially); 8, J. V. Robinson; 35, Phillips.

Fourth Day.—Circular Run from Shrewsbury, through Llangollen, Corwen, Bala, Blaenau Festiniog, Llandudno, Chester, and back to Shrewsbury. 191½ miles.

The competitors were started off at 8 a.m. by Mr. C. E. Rackham, of the Palmer Tyre, Ltd., who is acting in the official capacity of starter. The morning was fine, but very chilly for the time of year, but eventually the day turned out gloriously fine. For fifty-two miles

The Six Days' Reliability Trials.—

The route lay along Telford's magnificent road, probably the best graded in the British Isles, the surface of which was for the most part in first class condition. Almost the whole way to Llandudno the cold north-west wind blew in the faces of the riders, rendering the travelling unpleasant. Just beyond Corwen the road to the left to Bala was taken, which was in very fair order. The gradients were easy for the first nine miles, and just on entering the latter town a beautiful glimpse of the lake and the high peaks beyond it was obtained. The higher mountains were capped with clouds, and, though it rained slightly, no heavy showers fell. In Bala a turn to the right was taken up a steep hill, and then a pretty glen was traversed. Next followed a long easy ascent leading into wild and picturesque country. Gradually the road deteriorated into a mere mountain track, the milestones only indicating that it led to anywhere in particular. The gradients also became steeper, and several severe pitches were encountered. To add to the competitors' difficulties, four or five gates had to be opened. On reaching the summit there was a fine gorge to be seen on the left, through which a mountain torrent leaped down the rocks, and the scenery on all sides was superb. Then came a somewhat abrupt descent into Festiniog, where later I was joined by Mr. Nisbet's car, which was placed at the disposal of the A.C.U. by the Bowden Syndicate, followed by A. J. Reynolds on the 3½ h.p. Humber, of the performance of which over the mountain road just traversed he spoke in glowing terms, eulogising to the skies the two-speed gear with which it was fitted. The Rover came later, and then all three cars proceeded to Blaenau Festiniog, that curious village surrounded on all sides by slate quarries, the scene of the second hill-climb. The Humber car carried Straight, who with Reynolds took the times, to the summit, while the allant little Delage brought Brooker to his post just below the finish on the steepest portion. The surface of the hill was much inferior to that on Dinas Iawddwy, but I do not think the gradient was so severe, nor was the course so long. The wind blew hastily down the course, but, fortunately, there was no rain.

The following is a record of the performances of the men as they passed the observer (Mr. Grove) about half-way up and myself near the summit: First section (half-way up).—40 got off and ran, 17 very good, 11 very good, 19 good, 8 good, 20 good, 21 good, 4 good, 24 pedalled, 3 just got up, 22 good, 28 splendid, 3 good, 51 very good, 43 very good, 26 splendid, 14 ran into side and fell, 5 pedalled, 16 good, 66 good, 65 good, 10 pedalled, 46 pedalled, 23 running alongside, 25 splendid, 48 good, 34 good, 32 very good, 27 very fast, 44 fair, 43 good, 52 good, 39 very fair, 6 good, 5 very good, 63 good, 57 good, 56 dismantled, 15 dismantled, 70 pedalled, 1 dismantled, 47 good, 8 good, 9 pedalled, 7 pedalled, 64 dismantled, 39 good, 58 pedalled, 60 good, 61 good, 68 pedalled, 2 assisted by pushing with foot from good, 50 very good, 59 dismantled, 62 pedalled, 69 failed, 30 pedalled after impeded by 69, 72 pedalled, 54 splendid, and 74 shed passenger. Second section (near summit).—17 excellent, 40 dismantled, 11 dismantled, 19 failed just below the finish, 18 good, 20

excellent, 21 good, 4 excellent, 29 pedalled slightly (excellent), 22 excellent, 13 dismantled, 28 took the hill in magnificent form, 3 excellent, 51 excellent, 49 excellent, 26 a performance only equalled by 28, 27, and 25, 5 excellent, 16 successfully climbed the hill, slipping the driving clutch, 14 good, 66 excellent, 65 good, 10 pedalled, 46 pedalled, 24 excellent, 23 dismantled, 48 excellent, 32 excellent, 34 excellent, 43 good, 44 good on low gear, 52 dismantled, 39 excellent, 6 dismantled, 63 good, 45 came up slowly on low gear, 57 excellent, 56 dismantled, 70 pedalled, 15 dismantled, 47 pedalled, 9 pedalled and got up comfortably, 7 a similar performance, 37 excellent, 50 probably the best performance of a single-cylinder, 1 dismantled, 64 dismantled, 59 (who yesterday ran into a dog, then ran short of petrol and successfully reached Aberystwyth on paraffin) pedalled, 30 pedalled lightly, 69 pedalled, 71 good, 54 pedalled, 58 good, 59 good, 61 (belt slipping) pedalled, 74 dismantled, 68 pedalled, and 12 dismantled.

Leaving the summit the competitors descended into a beautiful valley leading into the Fairy Glen, and

Restarting from Devil's Bridge, near Aberystwyth. (Wednesday's luncheon stop), T. Woodman (7 h.p. V.S.) in the foreground.

joined the Holyhead Road at Bettws-y-Coed. Here they took the right fork and proceeded along a winding road to Llanrwst and on to Llandudno, where they lunched at the L. and N.W.R. Hotel. The latter section proved trying on account of the number of turns, and the men found it difficult to maintain the legal limit. At Llandudno the sun shone gloriously in a cloudless sky, the weather became warm, and with a strong wind behind a good journey was made through Flint, Chester, and Wem to Shrewsbury. I left the route just south of Bettws-y-Coed and journeyed back by the Holyhead Road. At Cerrig-y-Druoidion I met Andrews (2 h.p. Moto-Rêve) in tow of the G.W.R. motor omnibus. He had stripped some teeth off the magneto driving wheels, and was out of the competition, so I took charge of him and towed him towards headquarters. Near Chirk I came upon Pershke (6 h.p. Puch and sidecar) hopelessly broken down through magneto trouble. With the aid of Andrews's Watawata

The Six Days' Reliability Trials.—

and a strap I took him also in tow and brought them safely back to Shrewsbury. On our arrival the sad news came to hand that the ever-energetic Reynolds had been run into by a motor cyclist who came out of a side road near Chirk, and was severely shaken, but fortunately not seriously hurt. He was, I am glad to say, well enough to be brought back in the Rover. Compared with yesterday, to-day's run has been comparatively easy, and troubles have been few. There were the two retirements referred to above, and, besides these, Bevir (3½ h.p. L.M.C.) retired through a broken timing wheel, and Wells was reported to have had carburettor trouble. Tatham and Draper both had punctures. Davies again had a stuck throttle, and similar slight *contretemps* were experienced by other riders.

The 5 h.p. Rex and sidecar driven by Lord was driven 120 miles after an encounter with a ditch. I saw the machine, and marvel at Lord's grit in sticking to his mount. The front forks were twisted all on one side, but Lord quickly straightened them, and,

A few puncturing instruments collected by F. G. Cove in a length of ten yards on the test hill, Blaenau-Fesuniog. The mill is close to some slate quarries, and it is thought the articles depicted have fallen from carts used to transport the slate.

although the front tyre was practically rubbed through, he succeeded in reaching Shrewsbury at a somewhat late hour.

The following reached Shrewsbury this evening: 40, 11, 17, 4, 19, 20, 18, 21, 28, 3, 22, 5, 49, 10, 34, 65, 29, 43, 44, 38, 52, 56, 64, 39, 63, 26, 7, 9, 50, 37, 32, 24, 33, 51, 18, 48, 1, 47, 25, 45, 46, 13, 56, 57, 54, 69, 16, 30, 70, 6, 74, 61, 58, 60, 72, 68, 62, 59, 41, 12, and 33. 14 retired (broken piston).

The following lost marks in to-day's run: Boddington, 17; Ommaney, 68, retired (broken piston); Teage, retired (tank leaking); Lord, 86 (spill at corner); Holroyd, 121; Wood, 110; Simpson, 15; Fenn, retired (had fall and damaged magneto drive).

A smoking concert, organised by the Shropshire M.C. Club, was held this evening (Thursday), and proved a great success. At the concert R. M. Brice announced that, in appreciation of the valuable assistance rendered by the S.M.C.C., the competitors have subscribed amongst themselves for a silver cup. Great regret was expressed regarding Mr. A. G. Reynolds's

accident, and everyone heartily wished him a speedy recovery. Mr. F. Straight, the secretary of the A.C.U., thanked the Shropshire Club for its valuable help, and referred particularly to the assistance given by Mr. A. Benham.

Fifth Day.—Circular Run from Shrewsbury, through Market Drayton, Middlewich, Macclesfield, Cat and Fiddle, Matlock, Derby, Uttoxeter, Stone, Crudgington, and back to Shrewsbury. 177 miles.

To-day's journey was begun in splendid weather, and thanks to Mr. Straight I was given a seat on the Humber car, which soon caught up the stragglers on the Market Drayton Road. The surface of the roads was excellent, and few riders were seen in trouble. Middlewich was an exceedingly difficult town to negotiate. First of all the men had to turn sharply to the right, and then came an abrupt turn to the left over a very steep and narrow bridge. Near Hankelow, at a sharp corner, we came upon the Zenith and sidecar which had run into the hedge, smashing the sidecar seat, but fortunately doing no further damage. Miller, the driver, successfully patched things up well enough to proceed, and he was last seen at the luncheon stop. Beyond a few corners the road to Macclesfield presented no serious difficulties, but at Nantwich news came to hand that Tatham (3½ h.p. Matchless) had broken his exhaust valve some twenty miles away, and was unable to obtain a spare one. After the officials had consulted together the previous night, it was decided to omit the Cat and Fiddle Hill from the list of timed ascents, owing to the gradient being too easy, and with this I entirely agreed. So well graded is the pass over the moors that a 2¾ h.p. Douglas, driven by an amateur spectator, easily held its own with a 20 h.p. car. Moreover, the corners proved quite difficult enough under ordinary conditions. B. H. Davies fell and broke his rear brake rod at one corner, and Tatham, who got going later, had a similar *contretemps* and was put out of the running.

Here, as everywhere, there were a number of motor cycling spectators; in fact, in every part of the country traversed have people taken a great interest in the competition, while the police have been of the greatest possible assistance. From the summit the road descends into Buxton, and after the climb up to Tadlington it is downhill all the way into Matlock Bath. The ride through the dales was particularly beautiful, the road was in good order though dusty, and, fortunately, there was no rain here, as when the surface is wet it is particularly treacherous. At Matlock Bath the men had a most excellent lunch at the Royal Hotel. Then they proceeded through Belper and Derby to Uttoxeter, Stone, Eccleshall, and High Ercall to Shrewsbury. After lunch several showers were encountered, and about thirty miles from Shrewsbury it began to rain in earnest, and a wet evening set in. To the list of retirements must be added the names of Tatham (who had hitherto lost no marks, and retired through a spill about a mile from Macclesfield), Davies (who stripped a pin in his timing gear near Buxton), Outwin (who fell at a bad corner near Stone in trying to avoid a motor cyclist and a cart), Brice (who in trying to evade a child in the roadway collided with a wall near Hodnet not long after the start), and Miller (the driver of the Zenith and sidecar, who up to the time of writing has not arrived).

The Six Days' Reliability Trials.—

Sixth Day.—Shrewsbury to Uxbridge via Much Wenlock, Kidderminster, Worcester, Malvern, Gloucester, Birdlip Hill, Cirencester, Henley-on-Thames, Maidenhead, and Slough. 171½ miles.

It was with much regret that we all said good-bye to Luff-Smith's garage at Shrewsbury, at which the competitors had been so well looked after during the past week. The morning was gloriously fine, but a cold strong north-west wind blew, fortunately, in favour of the competitors during the day's journey. After an easy run of ten or fifteen miles the men had to climb Harley Hill again, near Wenlock, a report of the performances over which I sent down in my report of the first day's run. From Bridgnorth to Kidderminster the road is hilly, but it is not so severe as on the outward journey. Bridgnorth is an awkward town to traverse, but the route was admirably marked by means of the now famous A.C.U. arrows. From Kidderminster on a good run was made to Worcester, where at the Cross a turn was made to the right which led to Malvern, through glorious country, and on to Newent, Ledbury, and Gloucester. From the latter town the men proceeded straight to Birdlip Hill, on the summit and at the steepest portion of which a good crowd of spectators had gathered. The following is a report of the performances from two points at the Knap and at the summit:

At the Knap, gradient 1 in 5½.

W. O. Bentley (3½ h.p. Rex) dismantled; T. H. Tessier (7 h.p. Bat), a splendid performance. The behaviour of the Bat machines on all the hills throughout the trial has been quite remarkable. W. H. Wells and G. Lee Evans (5 h.p. Indians) covered the steepest portion in excellent style, but, though the former was successful, the latter was less fortunate. W.

A competitor climbing Birdlip Hill at full speed on Saturday last. The behaviour of some of the pedalless machines was quite remarkable, and caused great excitement among the spectators.

Douglas (2¾ h.p. Douglas) pedalled but got up in good form; J. O. M. Dixon (5 h.p. Vindec) good; P. Phillips (2¾ h.p. Douglas) pedalled but got up well; A. D. Draper (3½ h.p. Matchless) pedalled;

C. Williams (3½ h.p. Triumph) pedalled; T. Canby, W. Milnes, and W. Pratt (3½ h.p. Phelon and Moores) came up comfortably on the low gear; R. Moore (3½ h.p. Phelon and Moore) dismantled. Owing to an experimental high compression engine,

A. J. Sproston (5 h.p. Rex, 76×80 mm.) and O. C. Godfrey (3½ h.p. Rex, 82×89 mm.) on the summit of Birdlip Hill. These two riders performed very consistently throughout the trials.

Moore has been unsuccessful on the hills for the first time in the numerous long distance trials in which he has entered. P. J. Evans (3½ h.p. Humber), belt slipping, pedalled hard; F. C. Mustard (3½ h.p. Triumph) and G. E. Carrow (3½ h.p. T.T. Triumph), both excellent; H. H. Bowen (6-7 h.p. Bat) excellent; A. V. Sumner (3½ h.p. Humber) dismantled; T. Woodman (7 h.p. V.S.) dismantled; R. Fletcher (3½ h.p. Premier) dismantled; R. W. Duke (3½ h.p. Triumph) excellent; J. Marshall (3½ h.p. Triumph) splendid; F. Southam (3½ h.p. Triumph) splendid; G. H. Lane (3½ h.p. Triumph) dismantled; G. Gibson (3½ h.p. Triumph) excellent; A. J. Sproston (5 h.p. Rex) dismantled; F. S. Barnwell (3½ h.p. Triumph, with Roc gear) came up in excellent style on low speed; O. Parker (3½ h.p. Humber) excellent; F. W. Barnes (3½ h.p. Zenith Gradua) excellent; H. B. Lewis (3½ h.p. Triumph) dismantled; W. H. Bashall (6-7 h.p. Bat), a splendid performance; A. Weatherill (3½ h.p. Zenith Gradua) dismantled; J. Slaughter (3½ h.p. Triumph) excellent; the Rev. B. Aston (3½ h.p. Triumph) dismantled; G. L. Fletcher (2 h.p. Moto-Rêve) pedalled but came up in good form; O. C. Godfrey (3½ h.p. Rex) excellent; P. Platt (3½ h.p. Bradbury) pedalled; F. C. Wood (4 h.p. N.S.U.) excellent on low gear; W. F. Newsome (3½ h.p. Triumph) excellent; W. Smith (2 h.p. Moto-Rêve) dismantled; J. F. Crundall (3½ h.p. Humber) dismantled, belt slipping; J. Holroyd (1¼ h.p. Moto-sacoche) pedalled lightly, and came up in excellent form; J. T. Bashall (3½ h.p. Triumph) excellent; G. E. Stanley (3½ h.p. Premier) good; A. J. Stevens (3 h.p. Wolf) excellent; F. G. Boddington (3½ h.p. Rex) dismantled; G. Simpson (3½ h.p. Bradbury) pedalled; R. King (3½ h.p. Triumph) dismantled.

The Six Days' Reliability Trials.—

Those competitors who soared over the top of the hill without pedalling and deserve special mention are T. H. Tessier (Bat), W. H. Wells (Indian), J. Slaughter and J. T. Bashall (Triumphs), W. H. Bashall and H. H. Bowen (Bats), O. C. Godfrey (Rex), R. W. Duke, F. Southam, F. C. Mustard, W. F. Newsome, J. Marshall, and G. Gibson (Triumphs), G. E. Stanley (Premier), F. W. Barnes (Zenith Gradua), G. E. Carrow (Triumph), and A. J. Stevens (Wolf). The following made clean ascents, using the low gear: W. Pratt, T. Canby, and W. Milnes (P. and M.), F. C. Wood (N.S.U.), A. V. Sumner (Humber), and F. S. Barnwell (Triumph).

At Birdlip came the news that H. Berwick (3½ h.p. Excelsior) had retired near Malvern through a broken gudgeon pin. Lunch was served at the Royal George Hotel, after which the men started on the last portion of their journey. All the morning the roads had been magnificent, but from Birdlip on they became very rough and full of holes almost the entire way to Uxbridge. Outside Cirencester I passed Lee-Evans (Indian) in trouble by the roadside, and later on learned that he had suffered a seized piston and retired.

The route after leaving the picturesque old town of Cirencester lay through Fairford, Lechlade, and Abingdon, to Dorchester, where the Oxford-Henley road was joined. It had rained all down the route previously, and the dust was consequently not nearly so trying as on the first day. The weather kept gloriously fine the whole time, and, though it rained heavily in London nearly all day, the competitors escaped it all. Out of Henley-on-Thames, and between that town and Maidenhead, several stiff hills had to be negotiated, but after that the country was flat. Once through the unnecessarily long ten-mile limit in Slough the journey was almost over. Then came a turn to the left near Colnbrook, a short section of by-road, and then Uxbridge was reached, where a crowd of people welcomed the survivors.

Those who arrived up to 9.30 p.m. are the following: A. D. Draper (3½ h.p. Matchless), C. Williams and G. H. Lake (3½ h.p. Triumphs), W. Douglas and P. Phillips (2¾ h.p. Douglas), W. O. Bentley and F. G. Boddington (3½ h.p. Rex), W. H. Wells (5 h.p. Indian), W. Pratt, R. Moore, W. Milnes, and T. Canby (3½ h.p. Phelon and Moore), J. Slaughter (3½ h.p. Triumph), W. H. Bashall, H. H. Bowen, and T. H. Tessier (6-7 h.p. Bat), W. Smith and G. L. Fletcher (2 h.p. Moto-Rêve), A. J. Sproston (5 h.p. Rex), O. C. Godfrey (3½ h.p. Rex), F. Southam, R. W. Duke, and F. C. Mustard (3½ h.p. Triumph), J. O. M. Dixon (5 h.p. Vindec), J. Holroyd (1¼ h.p. Motosacoche), J. F. Crundall, F. Edmond, A. V. Sumner, O. Parker, and P. J. Evans (3½ h.p. Humber), F. C. Wood (4 h.p. N.S.U.), W. F. Newsome, J. Marshall, and G. Gibson (3½ h.p. Triumph), G. E. Stanley (3½ h.p. Premier), A. Weatherilt (3½ h.p. Zenette Gradua), J. W. Morris, G. Simpson, P. Platt, and J. Eastwood (3½ h.p. Bradbury), G. E. Carrow and F. S. Barnwell (3½ h.p. Triumphs), T. Woodman (7 h.p. V.S.), H. B. Lewis (3½ h.p. Triumph), R. Fletcher (3½ h.p. Premier), B. Aston (3½ h.p. Triumph), and A. J. Stevens (3 h.p. Wolf).

In addition to the retirements of Evans and Berwick mentioned above, must be added J. T. Bashall (3½ h.p. Triumph), who broke his engine-shaft ball race near Abingdon; O. Lord (5 h.p. Rex and side-

car), reported broken frame—he came in very late on Friday night, but started this morning; F. Dover (3½ h.p. Triumph) and R. King (3½ h.p. Triumph), neither of whom arrived at Uxbridge by 9.30 p.m. Altogether there have been twenty-six retirements, and forty-eight have come through successfully.

Owing to the accident to A. G. Reynolds, the other judges—J. W. G. Brooker, H. G. Cove, and H. A. Macdonald—were short-handed, and were consequently unable to get out a provisional list of those who had lost no marks. We, however, hope to publish the results in full in next week's issue.

The Trial has certainly been the most arduous ever held by the Auto Cycle Union, and probably it will result in the 1910 machines being vastly improved. The organisation was good throughout, thanks to the good work put in by the judges and Mr. Straight and his assistant Beesley, and everyone agrees that the Trial was a great success. Though severe, it is comforting to note that nearly all the machines which finished were in first-class condition, some looking as if they had but just been delivered instead of having undergone one of the most severe tests ever organised

Safely back at Uxbridge last Saturday evening. Reading from left—J. Marshall, ———, J. Slaughter, and F. H. Southam, who all rode 3½ h.p. Triumphs.

for motor cycles. Everywhere the men were well received, and not a single case of any trouble with the police is reported. Great assistance at Shrewsbury was rendered by Mr. A. Benham, the secretary of the Shropshire Motor Cycle Club; Mr. R. O. Phillpot, Mr. E. L. Fehr, of the Liverpool M.C.; and Mr. J. Haslam, secretary of the Sheffield and Hallamshire M.C.C. All round Uxbridge the arrangements were most ably carried out by Mr. F. H. Mullett, secretary of the Western District M.C.

THE NEXT BROOKLANDS MEETING.

Five events for motor cycles will be run on Saturday, July 31st, and August Bank Holiday, August 2nd. They are as follows:

THE JUNIOR MOTOR CYCLE HANDICAP. Cub. capacity under 500 cub. centimetres.

THE AUGUST MOTOR CYCLE HANDICAP. Cub. capacity over 350 and under 750 cub. centimetres.

THE SENIOR MOTOR CYCLE HANDICAP. Cub. capacity over 500 and under 1,000 cub. centimetres.

THE SECOND CHAMPION MOTOR CYCLE PLATE. Cub. capacity under 1,000 cub. centimetres.

THE SECOND ROADSTER MOTOR CYCLE HANDICAP. For roadsters; cub. capacity under 1,000 cub. centimetres.

Owing to great pressure on our space due to the Six Days' Trials, we are compelled to hold over several of the usual features, including many club items.

CLUB NEWS.

Bradford M.C.C.

Entries for the open hill-climb at the Steep, Denholme, on Saturday next, close to-morrow (Thursday), and should be forwarded to Felix Scriven, Alma House, Bradford.

Ayr and District M.C.

A petrol consumption test was held on the evening of the 11th inst., over a circular course extending from Ayr to Laybole via the Shore Road, returning by Minnishant, a distance of twenty-three miles. There were fourteen competitors, and results, based on formula, were as follows:

SINGLE-CYLINDER CLASS.

	Fig. of merit.	M.P.G.
Chas. Carver (3 h.p. N.S.U.)	23.65	122.4
John Robertson (3½ h.p. Minerva)	22.41	103.4
John Merideth (3½ h.p. Triumph)	22.08	97.7
Matt Brown (3½ h.p. Bradbury)	21.92	89.1

TWIN-CYLINDER CLASS.

	Fig. of merit.	M.P.G.
Alf. Sommerville (5-6 h.p. Rex)	27.36	85.3
Quintin Clark (5-6 h.p. Rex)	26.11	81.8
D. Robertson (4-5 h.p. Minerva)	21.28	82.1
Geo. Cocker (5-6 h.p. Rex)	19.37	63.0

Lincolnshire M.C.C.

The hill-climb arranged by the above club at Bully Hill on Saturday last proved quite successful. The hill is exceptionally severe, and was in bad condition, the rain having cut gullies across the road and loosened the surface. Some of the machines failed, but good time was made, particularly by J. W. Clarke (5 h.p. twin Rex). The gear ratio reckoned in the formula, but as the results were not ready when our report was despatched, we hope to give the results next week.

Daimler M.C.C.

A successful reliability run to Cheltenham was held on the 11th inst. The following successfully completed the run, the unsettled weather limiting the number of starters: R. B. Verney (3½ h.p. Rex), L. Carter (3½ h.p. W. and P.), R. M. S. Maxwell (3½ h.p. Triumph), A. E. Gorton (3½ h.p. Rex), C. Evans (3½ h.p. Rex), A. Turner (3½ h.p. T.T. Triumph), C. Moulder (3½ h.p. Triumph), C. Williams (3½ h.p. Rex), and S. Davis (3½ h.p. Rex).

Silver medals were gained by R. B. Verney, A. E. Gorton, and R. M. S. Maxwell, these being nearest to the set speed of nineteen miles per hour, and making non-stop runs.

New Inter-club Hill-climbing Competition.

Mr. F. A. Bolton, J.P., president of the Derbyshire and North Stafford Automobile Club, having inaugurated an annual hill-climbing competition for motor cyclists and presented a handsome silver challenge cup, the first contest was held on Saturday last at Oakamoor, North Staffs. The clubs taking part were the Derbyshire and North Stafford, Derby and District, and Mid-Staffs. Automobile Clubs, and the Birmingham University Motor Club. There were eighteen competitors. In addition to the cup, a silver medal was awarded to the winner, a bronze medal to the runner-up, and a silver medal to the one making the fastest ascent. This was secured rather easily by H. R. Fowler, of the Birmingham University Club, on a 5-6 h.p. Rex, the course (nearly a mile long) being covered in 1m. 24½s.

Competitors at the foot of Bully Hill, Lincolnshire, on the occasion of the Lincolnshire M.C.C. Hill-climb on Saturday last.

Saturday's contest was run off on handicap lines, a formula being used to ascertain the theoretical time in which each machine should complete the course, and the handicap fixed accordingly. Some exciting finishes were witnessed, particularly in the final, when the two riders were within a length of one another. Details:

First round. Heat 1.—C. E. Fowke (3½ h.p. Triumph), 5s. start, 1; W. H. Scott (3½ h.p. Triumph), 2. All others were given byes in this round.

Second round. Heat 1.—E. Russell, Derby (4 h.p. Chater Lea-Antoine), 1; B. L. Nicholson, Derbyshire and North Stafford (3½ h.p. Triumph), 7s., 2.

Heat 2.—C. E. Wallis (3½ h.p. Triumph), 1; C. T. Leech, Derby (2 h.p. Moto-Rêve), 31½s., 2.

Heat 3.—D. C. Bolton, Derbyshire and North Stafford (5-6 h.p. F.N.), a bye.

Heat 4.—W. B. Rudge, Mid. Staffs. (3½ h.p. Triumph), 2½s., 1; C. E. Fowke, 2.

Heat 5.—T. Waring, Mid. Staffs. (3½ h.p. Triumph), 2½s., 1; J. W. Cox, Derby (3½ h.p. Triumph), 2.

Heat 6.—H. R. Fowler, Birmingham University (5-6 h.p. Rex), 1; C. R. Wilkins, Derby (3½ h.p. Triumph), 13½s., 2.

Heat 7.—M. Nicholson, Birmingham University (7-9 h.p. Vindec Special), 1; W. Bennison (5-6 h.p. F.N.), 15½s., 2.

Heat 8.—J. C. Nevitt, Mid. Staffs. (3½ h.p. Triumph), 8½s., 1; E. J. Bolton, Derbyshire and North Stafford (5-6 h.p. F.N.), 2.

Third round. Heat 1.—C. E. Wallis, 11½s., 1; E. Russell, 2.

Heat 2.—W. B. Rudge, 14s., 1; D. C. Bolton, 2.

Heat 3.—T. Waring, 20½s., 1; H. R. Fowler, 2.

Heat 4.—J. C. Nevitt, 11½s., 1; M. Nicholson, 2.

Semi-final. Heat 1.—W. B. Rudge, 2½s., 1; C. E. Wallis, 2.

Heat 2.—T. Waring, 1; J. C. Nevitt, 2. Level start.

Final.—T. Waring, 1; W. B. Rudge, 2. Level start.

The competitors and their friends were afterwards entertained to tea at Moor Court, Mr. F. A. Bolton's residence.

Scarborough and District M.C.

The committee of the above club has decided to give notice to the Auto Cycle Union of its intention to terminate in December next the agreement of affiliation with the A.C.U., a vote of the general members having resulted in a majority of twenty in favour of withdrawal. A hill-climbing competition (confined to members only) was held last Wednesday evening on Cloughton Bank, and proved most enjoyable to all who took part in it. The positions of the competitors, worked out on handicap formula, are as follows:

Actual times.

CLASS I. LIGHTWEIGHTS.	M. S.
Herbert Swift (2 h.p. Moto-Rêve)	1 22½
T. Jackson (2½ h.p. B.M.)	Withdrew.
G. Storey (2¾ h.p. Minerva)	Withdrew.
G. Coates (2 h.p. Moto-Rêve)	Withdrew.

CLASS II.	M. S.
H. Plewes, Goole (3½ h.p. Triumph)	0 37½
J. Wilks (3½ h.p. Minerva)	0 37½
C. Pugh (3½ h.p. Minerva)	0 50
A. Hart, Hunmanby (3½ h.p. Triumph)	0 47½
Dr. B. Forman, Cloughton (3¾ h.p. N.S.U.)	0 58
H. Swift (2 h.p. Moto-Rêve)	1 18
T. S. Webster, Seamer (3½ h.p. Brown)	0 55
E. Dent, York (3½ h.p. N.S.U.)	Did not start.
T. Lambert (3½ h.p. Triumph)	Dismounted on hill
J. Hornby (3½ h.p. Brown)	"
J. W. F. Stanmer (3½ h.p. Brown)	"
H. Frain (3½ h.p. Humber)	Withdrew.

As a result of the slight difference of time, ½s., between the winner H. Plewes and J. Wilks, a sporting event between them is being arranged.

The End-to-end Record.

As we go to press we are advised that a well-known Midland rider started from John-o'-Groat's early Wednesday morning to break the End-to-end record. If he is successful a full account of the ride will appear next week.

Club News.—

Bristol Bicycle and M.C.

A penalty run for motor cyclists has been arranged for the 24th inst., starting from top of Filton Hill to Tetbury and return, the distance being about seventy-two miles.

Wimbledon and District M.C.

This club includes Epsom in its district, and the secretary, Mr. E. A. Roberts, would be pleased to hear from any Epsom motor cyclist as to joining. His address is 33, Griffiths Road, Wimbledon. The club is affiliated to the A.C.U.

Edinburgh Waverley M.C.

Three riders obtained full marks in the recent reliability trial. The route was by Berwick across to Greenlaw, then on to Carfraemill, and up Soutra Hill (on which competitors were timed) to Edinburgh, the distance being 120 miles. The riders were: J. M. Dobson (5 h.p. Vindec), A. H. Alexander (3½ h.p. Rex), and T. Durie (3½ h.p. Triumph).

Warrington and District M.C.C.

The winners of the hill-climb have now been declared on A.C.U. formula as follows: 1, Dr. J. Howard (3½ h.p. Triumph); 2, H. Cartwright (3½ h.p. Triumph); 3, J. Wilding (3½ h.p. Triumph). Passenger class—C. H. Woods (3½ h.p. Raleighette). Prize for fastest time on hill, Mr. Jordan (3 h.p. Twin Bat). The fixture was so successful that another is to be held on August 2nd.

Sheffield and Hallamshire M.C.C.

The club's reliability trial for the Hutton shield takes place on Saturday next, the 17th inst., the route being Sheffield to Holyhead and back, a distance of 324 miles. The competitor running nearest the average of eighteen miles per hour holds the shield for twelve months, and takes the club's gold medal. Second and third awards are given and bronze medals to those riders doing an average of seventeen miles per hour.

The club's hill-climb, which takes place between July 12th and 31st is to be run under rather novel conditions this year. Competitors, who will be handicapped from a dummy time, will be allowed six ascents any time between the above dates, the best of these times to count. Notification to be made to timekeeper when wishing to make an ascent. For handicapping purposes the following data will be taken into account: Bore and stroke of engine, weight combined of machine and rider, known capabilities of rider. The idea of the committee is to give every rider a chance, be he novice or expert. Members please remember this and enter.

A.C.U. Six Days' Trials. Some of the officials at the summit of Blaenau Festiniog. Mr. J. R. Nisbet is sitting on the running board of his 30 h.p. Humber, Mr. F. Straight is in the car, Mr. Brooker on the left, and Mr. Macdonald next to him.

Motor Cycling Club.

The twenty-four hours reliability trial for motor bicycles starts on Friday evening next at 8 from Taplow. The competitors will run *via* Henley to Oxford and back through High Wycombe, Beaconsfield, to Taplow, distance about seventy-five miles. This route will have to be traversed six times in all, making a total distance of approximately 450 miles.

Coventry and Warwickshire M.C.

The winners of the special prizes in the Holyhead run are: 1st, G. T. Mills (3½ h.p. Triumph); 2nd, H. Williamson (3½ h.p. Rex).

The open hill-climb is fixed for Saturday, August 21st, and entry forms and rules will be available very shortly.

Four members visited Shrewsbury on Thursday evening last to have a chat with the A.C.U. trials competitors and officials. Mr. J. K. Starley drove the party on a 20 h.p. Rover, and the return journey in the early hours of Friday was most enjoyable.

LAST WEEK'S
RELIABILITY
TRIALS.

Starting point of the Blaenau Festiniog hill-climb amongst the slate quarries. This hill, although very severe, is not so bad as Dinas, but it was included in Thursday's run of 188 miles.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Belts for Passenger Work.

[4130.]-In reply to "AP 5" [4059] who wrote in *The Motor Cycle* regarding belts for use with sidecar, I can recommend him the lin. Giant Watawata. I tried several until I got a lin. intermediate, and with this I did thousands of miles during 1907-1908, but the Giant is even more satisfactory.

W. E. NEWBERY.

Engine Speed and Vibration.

[4131.]-I understand that the generally accepted idea is that the greater the engine speed of a motor cycle the less perceptible is the vibration, eliminating vibration from road shocks. Now, in practice, I have found this quite the reverse, i.e., that the faster the engine is run the greater the vibration, when, according to popular supposition, it should have been less. I may add that my experience has been gained from more than one machine.

H. B. DEAN.

Valve Cap Washers.

[4132.]-Perhaps the following will be of some use to "E. T." regarding compression of 6 h.p. J.A.P. engine. I have an 8 h.p. three-cylinder same make, automatic valves, and ground seatings. I found great trouble in keeping the compression good owing to the yoke which holds down the seatings not being dead true. There is not depth enough for copper and asbestos washers. After several experiments, I found that three very thin brass washers cut out of a blank stencil plate, procured from a dealer in the latter for twopence, quite overcame the trouble. I also notice that a stronger inlet spring prevents a good deal of the blowing back—one fault of automatic valves.

NEMO.

The Brake Question.

[4133.]-Having followed correspondence on front v. back brakes for motor cycles, I would like to point out one advantage of a front brake, viz., suppose a motor cyclist is riding a machine fitted with back brakes only down an incline at a good speed, and rear tyre becomes suddenly deflated, the rider at once applies his brake in order to pull up, but in doing so back tyre tends to slip round the rim, causing inner tube to become damaged by tearing out valve, etc. On the other hand, if machine is fitted with front brake, not only does rider avoid this trouble, but also tends to throw more weight on to front wheel, thus saving back rim from damage.

D. COLTMAN.

Lubrication.

[4134.]-I think I can inform "Oile," who writes regarding lubrication, the reason of his difficulty. I do not think it is a matter of lubrication. I have had a similar experience with my Triumph, and I found this to be the cause. When the piston rings become worn, they expand slightly, and the compression is slightly weakened, the charge blowing past between the rings and the piston; a gradual sooting takes place in the bottom of the groove, which gradually forces out the ring against the surface of the cylinder. This, I think, accounts for the slight loss of compression, and the unwonted stiffness in starting. If the grooves were thoroughly cleaned with some sharp instrument and new rings fitted, I think his difficulty would disappear.

C. FORTESCUE READE.

A Veteran Rider.

[4135.]-In a recent "Current Chat" paragraph I notice an account of a cyclist who started riding in 1872. Perhaps my experience may be of interest.

I began "wheel life" in 1862 on a three-wheel Rantoon. In 1864 I had a Dublin velocipede (four-wheel), built to order; it weighed about 120 lbs., but I had plenty of fun out of it. In 1869 this gave way to my first "bone-shaker," by Micheau, of Paris. Then followed a Paragon, Excelsior, Challenge, Rudge Rotary, 'Xtraordinary, and Sparkbrook National, bought in 1899. This is still in use with the original covers. In 1900 came the Werner F.D. motor cycle, giving place in 1905 to a 2½ h.p. Lurquin and Coudert. This, after 10,044 miles, is doing well, the engine never having been touched, so you see I have been a regular rider for forty-seven years. I am now just sixty-three years of age, and in good running order. Next, please!

T. FREDK. HUNT.

A New Departure in Hill Climbing Competitions.

[4136.]-With reference to the articles that have appeared in *The Motor Cycle* on standard machines in competition, I should like to draw your attention to the fact that the Bradford Motor Cycle Club will hold an open hill-climb on July 17th, the great feature of which is that machines competing in the ordinary classes must be absolutely standard touring machines and standard in every possible respect, whilst Tourist Trophy and special racing machines will only be eligible for the classes set apart especially for them. Amateur riders may therefore enter with the assurance that they will have a good sporting chance of winning.

It is to be hoped that amateur riders throughout the country will respond to this effort of the Bradford Motor Cycle Club to cater for the average rider, and support it in its endeavour to run a hill-climb on these lines. A committee will be appointed to classify the competing machines before the event. There are eight classes, so nearly every type of machine is catered for.

FELIX SCRIVEN,
Hon. Trials Sec. Bradford M.C.C.

Low Voltage Coils.

[4137.]-It may be of interest to adherents of coil ignition generally to hear of the behaviour of low voltage coils under racing conditions.

The rate of saturation in a two-volt coil is necessarily slow, and I found on first applying the Voltcoo to my 85 by 60 mm. single that with ordinary adjustment of the points there was an inclination to misfire at high speeds. A close adjustment, however, overcame this difficulty, and its performance now is quite satisfactory.

My remarks are, of course, mainly applicable to the extremely high engine speeds necessary for my purpose. At ordinary road speeds I should say no alteration would be necessary.

As to economy in current consumption, for which, I presume, the coil is primarily intended, I can give no definite experience; but, judging from the ampèrage on "short" in conjunction with slow rate of saturation, I should think it would certainly be extremely economical, and certainly possesses many advantages over the ordinary four-volt coil.

C. R. COLLIER.

Appreciation of a Light Tricar.

[4138.]-After several journeys to London in search of a reliable British two-seater, which should enable one to travel easily over the ordinary roads, and also entail the least expense for running and upkeep, I finally arrived at Messrs. Brown Bros., Great Eastern Street. My search ended here, and I promptly placed an order for a 1909 5½ h.p. Brown, fitted with a Mills and Fulford forecar, belt drive, and the Brown two-speed gear and free engine.

Messrs. Brown Bros. spared no pains in building the machine to my particular requirements.

The engine is most substantially made, and its heavy fly-wheel, long bearings, and low position enable the machine to run with exceptional smoothness and steadiness. For flexibility it will be hard to beat. When road traffic demands extra care, one can quickly slow down to a crawl; and when the road is clear, a slight opening of the throttle as quickly brings it into its regular stride.

The Brown free engine and two-speed gear is a great boon, and is very simple to use and most efficient—foolproof, I should think—that is why I had it.

When the passenger is safely seated, one turn of the starting handle starts the engine in nine cases out of ten, thanks to the excellent trembler coil and make and break with which the machine is fitted. Then stepping into the saddle and

letting in the low gear, the machine glides forward, smoothly and gracefully, and in a few seconds has attained sufficient speed to enable the high and normal gear to be brought into use by a slight forward movement of the same lever. One can start and get under weigh as easily as a well-tuned car.

My journeys so far have been confined to the roads of Surrey and Hants. I have several times been to Salisbury *via* Guildford, Hog's Back, Farnham, Alton, Winchester, and Romsey, and it simply romps up all the hills on the top gear. The way it settles down to business when a hill has to be climbed, and the rhythmic humming of the exhaust, is a treat.

The combined weight of my passenger and self is about nineteen stones, and we average 18-19 m.p.h. The machine will travel much faster if required, but we are quite satisfied to keep within the legal limit—until it is raised.

Thanks to a Palmer Cord tyre which I have on the driving wheel, I can travel with very little fear of punctures.

I enclose a photograph of the machine, to show that graceful and neat design has not been sacrificed for strength and safety, and also that "the tricar is not dead yet."

JOHN T. MEW.

A Doctor's Grumble regarding Repairs and Replacements.

[4139.]-Now that the motor cycle is being used more and more by business men for business purposes, the question of repairs and replacements becomes a matter of urgent importance. The business man has not got the interval between the week-ends free for the ingenious fitter or the incompetent storekeeper to muddle about making mistakes.

In America, of course, the standardisation of parts has been carried to a logical conclusion. The result is the universal adoption of American machinery of all kinds, especially in out-of-the-way districts and countries.

For the past two and a half years I have had an old American car, which I can myself fit with any essential part, made in Detroit, and supplied to me from London by return of post or first passenger train, and which I can be perfectly certain will fit comfortably wherever it is designed to go.

At present I am riding an English-made motor bicycle, which after three months required certain small replacements, notably a worn engine pulley, which is a matter of frequent occurrence in our flinty neighbourhood, especially if the roads are wet. I sent the engine for other details to be seen to, and was promised return within the week. After vigorous telegraphing I got the engine back on June 14th, ten days later, with the new engine pulley not fitted, but loose in the packing case. I broke the old engine pulley getting it off, and then found the new pulley would not screw home by about three threads.

I see these machines compete in all the road trials and hill-climbs. What good do these things do as advertisements as compared with promptness, punctuality, and proper fitting, should the busy man (as in the nature of things he must) require repairs or replacements?

Is there a firm of motor bicycle makers, not foreigners, whose spares can be fitted into the engine without any lingering feeling that they are misfits more or less?

CHARLES S. PATTERSON, M.B., M.R.G.S.

[There is more than one British engine made on the interchangeable system, on which parts, ordered by post or telegram, will fit without filing, screwing, or tapping.—Ed.]

The Lightweight Question.

[4140.]-Having in the last month driven a 1½ h.p. lightweight and a 3½ h.p. heavyweight (both magneto), perhaps my opinions would interest some of the readers of your excellent and interesting paper. Each machine I drove about 500 miles. The result is that, in my own opinion, the heavyweight scores nearly everywhere. In speed and hill-climbing, the lightweight does not, and cannot, except with a very light rider—that is, as far as my experience goes—compare at all with the heavyweight. My weight is about 12 st. The 3½ h.p. machine was a splendid starter, going off nearly always at the first push. The lightweight was a very poor one to get going. Sometimes it was as much as thirty yards before it would get going well. Where the lightweight scores the most is in getting in and out of the shed or up steps. I did not find it very comfortable to ride owing to small tyres, a short wheelbase, and no footrests. For a man who only wants a machine for short journeys, does not want to average more than seventeen or eighteen miles an hour, and perhaps has to carry his machine up a flight of steps, there is no doubt the lightweight is the thing. But for anyone who wants to "get there," and do it promptly, to make long journeys, and to climb hills well, with a feeling that there is power in reserve, give me the heavyweight. By heavyweight I mean a machine weighing from 160 to 180 lbs.

Lastly, has any reader thought of the danger to health there is in riding a lightweight on a cold day, with heavy roads, and having to pedal hard to get over a sharp hill, getting very hot, and then sitting still again for perhaps eight or ten miles?

I daresay there are many who will disagree with this letter, but, like "Ixion," I have no special enthusiasm for the lightweight machine. EX-LIGHTWEIGHT.

Silence.

[4141.]-In reference to the letter of "T. H. C." in your number of June 16th, it is not correct to say there must be back pressure when the outlet area of a silencer is less than the inlet. As a charge of exhaust gas reaches the silencer only once in two revolutions of the engine, and as the gases are free to expand out of the silencer continuously, it follows that the presence or absence of back pressure depends on the speed at which the gases expand out of the silencer and the speed at which the engine is running. *A silencer with small outlet capable of getting rid of all the gases when running slowly might fail to do so at a high speed of engine, with consequent back pressure.*

I do not know if anyone has worked out the smallest possible outlet area without back pressure in relation to size of cylinder and speed of engine, but a formula giving this would be of great interest and value in allowing riders to see that their silencers were properly designed.

Although the outlet may be smaller than the inlet—and, I think, should be so to reduce noise—I agree with "L.B.C." in thinking that "L.B." has contracted his area too much. However, the design seemed so good that I copied it, with some modifications, for a 3 h.p. single-cylinder engine. I think the most important precaution to take is to make the silencer amply large, particularly as regards the first chamber into which the gases expand from the cylinder, so I made my silencer 8 in. long by 3½ in. internal diameter (see "L.B.'s" sketch), the first chamber being 4 in. long and the remaining 4 in. being divided by three diaphragm plates into four equal spaces. My inlet is 1½ in. diameter; the diaphragms have respectively 28 holes in., 64 holes ½ in., and 120 holes ⅜ in.; outlet is of ¾ in. and flattened to a fish tail. This makes my machine quieter than most that I hear, but I am not satisfied yet, and hope some day to experiment with other diaphragm plates having smaller holes.

Instead of a central tube and four longitudinal bolts shown by "L.B." I use one central bolt ½ in. diameter screwed all the way, the diaphragm plates being held at any distances desired by lock nuts each side, and the end plates being held by castle nuts and split pins. If I want cut-out I shall put it in the end plate nearest the inlet.

A.M.I.C.E.

Crossing the Severn with a Motor Cycle.

[4142.]—When lately crossing the Severn estuary at two points in going from Weston-super-Mare to Cardiff, I found that the direct line of boats allowed the carrying of petrol in the tanks, but I was informed that the boats running in connection with the railway did not permit it to be so carried. On returning by the Severn Tunnel the foreman porter at Severn Tunnel Station measured my petrol. After emptying the tanks he handed me a voucher addressed to the stationmaster at Pilning, the first station on the other side. On presenting this my tanks were replenished to the amount stated on the voucher, and I started again almost before the train was out of sight.

W.C.G.

Two-stroke Engines.

[4143.]—Although I have not very particularly followed the discussion on two-stroke engines, I may say that I am quite of opinion that it is the gas or petrol engine of the far future.

Not being an expert my opinion, of course, counts little, but my reason for writing is to show what has given me belief. It has been my pleasure (perhaps I ought to say honour) to inspect and have explained to me a two-stroke engine which as yet is not on the market, but which has been patented in fourteen countries at great cost by a gentleman in the West of England.

Using the crank case as a gas chamber is discarded, nor is a separate pump used, a complete scavenge is got, and therefore perfect combustion. This (to me) remarkable engine does not show any fire at exhaust port when silencer and pipe are removed, and the only mechanical working parts are three in number, viz., piston, connecting rod, and crank.

These features are attained by the simple means of using a piston (similar to rough sketch) of two diameters, which when fitted to cylinder forms three chambers, viz., (1) compression chamber, (2) pure scavenging chamber for scavenging cylinder previous to the inlet of gas from third chamber, automatic valves naturally being used.

Lubrication appears to be quite satisfactory, and the flexibility of the engine really astonishing. The interest of some large gas engine manufacturers points to its being an invention out of the common. I also am interested in it, but not financially (unfortunately).

PFAITCH.

Standard Machines in Competition.

[4144.]—With regard to "faked" machines in competitions, I should like to suggest that at some period a large competition be held under the following conditions, being, it would seem, almost the only way to ensure the use of representative touring machines. The organisation would require both trouble and expense, but the test would be by the most searching and impartial yet attempted.

Pick from a maker's stock of not less than ten (to prevent the building of several fakes) two machines haphazard, and seal them complete with tools and usual touring spares. At the competition the machines would be unsealed and handed over, one to a trade rider chosen by the makers, and one to an amateur, and these riders would be allowed one hour in full view of judges and the public in which to tune up and test the machines. Riders would bring no tools or duplicates and remove nothing from the machines. The competition would then take place, and would probably be divided into three sections. First, trade riders; second, amateur riders mounted on the identical machines the trade riders have just used; third, amateur riders on the second machines which have not yet been used.

Races or hill-climbs of this type should draw a large public interest and encourage the production of the practical and efficient everyday model of motor cycle.

S. F. B. LANE.

[4145.]—Regarding the A.C.U. hill-climb on Sutton Bank, the Rex Co. in letter No. 4114 condemn themselves. According to their own statement the Rex machine which won in two classes was a "Speed King" model and not a touring mount. The rules governing the competition laid down that only tourist machines in full tourist trim should compete.

It would be only right and fair now if Godfrey be made to return the prizes won in that competition, as the whole thing was a contravention of the A.C.U. rules, and should not have been allowed. Such tactics cannot be condemned too strongly.

W. E. HOLMES.

Mow Cop Hill, near Congleton, Climbed.

[4146.]—Having seen in *The Motor Cycle* at various times accounts of your readers having climbed some particularly stiff hill, we thought that the following might be of interest.

About four miles from Congleton is a very severe hill, known as Mow Cop. The average gradient, taken from the Ordnance map, is 1 in 12, and the length of the hill about half a mile, the steepest pitch, which is some fifty yards in length, being 1 in 3.3. The surface is rough and loose in some parts; there are also several bad ruts worn by the water running down.

I succeeded in climbing the whole length of the hill five times on my G.B., 4½ h.p. machine, Minerva engine, Roc two-speed gear, low gear 7½ to 1. My friend, on a 6 h.p. N.S.U., with forecar, N.S.U. two-speed engine pulley, low gear 7 to 1, also succeeded in climbing the whole length after removing the basket.

At present, so far as we can learn, only two other motor cycles have succeeded in getting to the top. The innkeeper of the Railway Hotel, which is on the steepest part, takes a great interest in any attempt at the climb, and has started keeping a register of all those that are successful.

Perhaps some of your numerous readers would like to have a try at the climb. I should very much like to hear of anyone who has tried the ascent on a single-gear machine as to how far he got up, as I do not consider it possible to get up the last part without a two-speed gear.

FT 18 AND M 1688

SUMMARY OF OTHER CORRESPONDENCE.

The motor cyclist who sent a message per another motor cyclist to Jones and Co.'s garage at Lichfield for a man to come out to the seventh milestone on the Coventry Road on the 6th inst. may be interested to know that the man spent several hours trying to find him, and that he returned to Lichfield at 7.30 p.m. wet through.

Zenith Motors, Ltd., write: As there seems to be a little misunderstanding as to handle starting with our machines, might we ask you to explain that with the Gradua gear, the handle being direct on to the engine, handle-starting is only recommended where accumulators are fitted. With magneto the gear ratios can be made so extremely low and the drive direct, that it is an easy matter to start the machine at a walking pace, bring it to a standstill, and then mount. This method has proved such a success that many of our customers who have gone to the expense of dual ignition, particularly for the sake of handle starting, have now entirely abandoned the handle in favour of this method.

THE FINGER POST TO ENJOYMENT

THE BRADBURY

3 1/2 h.p. MOTOR CYCLE.

To drive a motor cycle that is always requiring attention, and which cannot be trusted to climb anything but a mole-hill is not particularly enjoyable. It is only those who have experienced the delights of speeding comfortably along on a

Bradbury 3 1/2 h.p. Motor Cycle,

and secure in the knowledge that it is the reliable British-built machine, who know the full meaning of the word enjoyment as applied to motor cycling.

If you are interested, write for New Booklet and name of nearest Agent to

AWARDED 18 GOLD MEDALS, including the Special Gold Medal awarded to Mr. A. T. Stanton, of Leyton, in the London to Edinburgh Run.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

British Motor Cycle Racing Club.

FOURTH MEMBERS' MEETING.

THE young and vigorous British Motor Cycle Racing Club held another successful race meeting for its members on Wednesday last at Brooklands. The first event was the Novices' Handicap. Distance about 8¼ miles (fork start). For all classes of motor bicycles the cubical capacity of the engines of which did not exceed 1,000 cc., open only to those members who had never won a first prize in any motor cycle race held on an enclosed track. The machines entered had to be the *bonâ fide* property of the riders. Previous to the actual event a timed race was run off, on the performances in which the handicaps were based. It was announced that, should a competitor improve his time by a margin exceeding 2½% of the preliminary run, he should be disqualified from taking a prize. First prize, Brooklands silver cup, value £4; second prize, Brooklands silver cup, value £3; third prize, any article to be chosen by winner, value £1; fourth prize, value 12s. 6d.; fifth prize, value 7s. 6d. The starters were A. E. Morgan (5 h.p. Rex), A. Pennington (3½ h.p. Triumph), G. G. Mead (7 h.p. V.S.), W. H. S. Sharpe (3½ h.p. Triumph), H. E. Parker (7 h.p. N.L.G.), F. A. Hardy (3½ h.p. Norton), W. H. Wells

(5 h.p. Indian), M. Exshaw (3½ h.p. Zenith), and M. Krause (5 h.p. V.S.) Result: 1, Mead; 2, Wells; 3, Krause; 4, Pennington; 5, Morgan; Sharpe and Hardy. This and all the other races were started at the fork and finished down the straight, so that if one remained in the paddock it was impossible to follow the progress of the events. On the next occasion, however, we understand that both start and finish will be at the fork, so that the events will be much more interesting.

The next event was the All-comers' Handicap. Distance about 8¼ miles. For all classes of motor bicycles the cubical capacity of the engines of which did not exceed 1,000 cc. and not less than 450 cc. First prize, £1 1s.; second prize, 12s. 6d.; third prize, 7s. 6d., or value. The starters were: H. E. Parker (7 h.p. N.L.G.), scratch; C. R. Collier (6-7 h.p. Matchless), 40s.; H. A. Collier (6-7 h.p. Matchless), 40s.; W. H. S. Sharpe (5 h.p. V.S.), 45s.; W. H. Wells (5 h.p. Indian), 52s.; G. Lee Evans (5 h.p. Indian), 52s.; H. H. Bowen (3½ h.p. Bat), 1m. 12s.; A. G. Fenn (3½ h.p. Bat), 1m. 20s.; F. A. McNab (3½ h.p. Trump-J.A.P.), 1m. 32s.; F. A. Hardy (3½ h.p. Norton), 2m. 15s. Result: 1, Bowen; 2, Lee Evans;

G. G. Mead (7 h.p. Twin V.S.), winner of the Novices' Handicap.

British Motor Cycle Racing Club.—

3, Parker; McNab, Wells, H. Collier, C. Collier, and Sharpe. Winner's speed $62\frac{3}{4}$ miles per hour. The first event resulted in the following handicap: Mead, scratch; Wells, $5\frac{2}{5}$ s.; Krause, $16\frac{2}{5}$ s.; Pen-

nington, 1m. $18\frac{4}{5}$ s.; Morgan, 2m. $30\frac{2}{5}$ s.; Sharpe, 2m. $31\frac{3}{5}$ s.; Hardy, 3m. $40\frac{3}{5}$ s. At the end of the first lap, viewed from the fork, Pennington was leading, followed by Morgan and Sharpe. After an interval came Krause, Wells, and Mead. In the second lap Pennington was still leading, and after him came Morgan, Sharpe, Wells, and Krause. The finish was in the following order: Morgan, Pennington, Mead, Wells, and Krause. Winner's speed about $53\frac{3}{4}$ miles per hour. Pennington and Krause were disqualified for exceeding their time limit.

After tea there followed the record time trials, divided up into five classes: Class A, up to 275 cc.; Class B, up to 350 cc.; Class C, up to 500 cc.; Class D, up to 750 cc.; Class E, up to 1,000 cc. The competitors ran the reverse way from the fork to the railway straight, owing to the wind. There was some delay in starting, owing to a defect in the Brooklands electrical timing apparatus, thought at first to be a short circuit, but found afterwards to be due to the observer sitting peacefully with one foot on the contact strip. On the next page will be found the results of the competitors' attempts on the class records. It will be noticed that three records were broken, probably the most surprising being the wonderful speed attained by H. H. Bowen on a single-cylinder Bosch magneto ignited Bat-J.A.P.

The timekeepers were Major F. Lindsay Lloyd, R.E., Capt. F. Bagnall Wild, R.E., and Mr. A. V. Ebbelwhite. Mr. A. G. Reynolds was unable to be present, owing to the effects of his recent accident, but his brother was present, as was also Mr H. A. Macdonald, one of the A.C.U. judges, who went right through the Six Days' Reliability Trials.

The T.T. Handicap

followed. Distance about $8\frac{1}{4}$ miles. For all classes of motor bicycles the cubical capacity of the engines of which did not exceed 750 cc. First prize, £1 1s.; second prize, 12s. 6d.; third prize, 7s. 6d. The starters were: H. A. Collier (6-7 h.p. Matchless), scratch; H. H. Bowen ($3\frac{1}{2}$ h.p. Bat), 52s.; W. H. Wells (5 h.p. Indian), 12s.; G. Lee Evans (5 h.p. Indian), 12s.; G. G. Mead (7 h.p. V.S.), 35s.; A. G. Fenn ($3\frac{1}{2}$ h.p. Triumph), 40s.; F. A. McNab ($3\frac{1}{2}$ h.p. Trump-J.A.P.), 52s.; H. V. Colver ($3\frac{1}{2}$ h.p. Matchless), 52s.; G. L. Fletcher (2 h.p. Moto-Rêve), 2m. At the end of the first lap the machines

The All-comers' Handicap. F. A. Hardy ($3\frac{1}{2}$ h.p. Norton) starting.

Start of the Novices' Handicap. Distance, $8\frac{1}{4}$ miles.

British Motor Cycle Racing Club.—

*Gains certificate for best performance in his class.

At the Cat and Fiddle, Cheshire, on the fifth day of the A.C.U. Trials This inn is 1690 feet above sea level, and is generally considered to be the highest public house in England, but that honour belongs to the Tan Hill House, Yorkshire, which is 1727.3 feet above the level of the sea.

NOTES ON THE SIX DAYS' TRIALS.

The cause of Mr. Fenn's retirement was the breaking of an outside bearing in the timing gear and not in the magneto transmission gear as stated.

The only two Matchless motor bicycles entered were ridden by purely amateur riders, and one of these machines went through the End-to-end last year.

Owing to an unfortunate error, Mr. R. King (3½ h.p. Triumph) was reported in our last issue to have retired on the last day of the A.C.U. Six Days' Trials. This was not the case, as Mr. King was one of those fortunate competitors who ran through the whole competition without losing a mark.

Expanding pulley gears are said to be severe on belts, but Barnes (3½ h.p. Zenith-Gradua) used the same Stanley belt throughout the trials, and after 1,024½ miles it appeared in good condition.

The retirement of the twin Rex and sidecar on the last day of the Trials was caused by a broken frame, but this was not due to any fault in the manufacture, but solely to the accident which occurred on the Thursday, when in failing to negotiate a corner at high speed the driver ran the machine into a bank, buckling the front forks, front wheel, and the frame. The forks and wheel were replaced at Shrewsbury, but it was naturally impossible to replace the damaged frame. The combination had done exceedingly well and gained full marks up to the time of the accident.

One competitor went to the extent of carrying a spare

piston in a leather wallet, and a set of canvas mud protectors rigged up on sticks. We did not, however, see the device in use.

The thanks of all those concerned in the trials are due to all those chief constables through whose districts the routes passed. Not a single case of police interference was reported, though several of the areas traversed are reputed to be by no means free of traps. In many cases the police were of valuable assistance.

Mr. A. G. Reynolds fortunately made a rapid recovery from the nasty accident he suffered. He was well enough to be driven home in the Humber, and we are glad to say still continues to progress favourably enough to attend his business.

Holroyd, the rider of the Motosacoche, was received with vociferous cheers when he entered the Chequers' yard on Saturday. They were deserved, as the little machine really distinguished itself. The performances of the last named, the Moto-Rêves, and the Douglas on the hills were also much appreciated by the spectators.

A. T. Stanton's retirement was due to ill-luck. By some unaccountable means his lubricating oil tank was filled with what was afterwards discovered to be "varnish," although it was poured from a Vacuum tin. The Bradbury engine was practically ruined within the first forty miles, but Stanton kept doggedly on, and completed the greater part of the trial unofficially. The other four Bradburys in the trial finished successfully.

The A.C.U. Trials: List of Marks Lost.

Rider and machine.	1st day.	2nd day.	3rd day.	4th day.	5th day.	6th day.	REMARKS.*
W. H. Outwin (3½ h.p. Triumph)	0 ...	0 ...	16 ...	0 ...	— ...	—	Retired fifth day, upset while trying to avoid cart near Stone.
E. Nelson (5 h.p. Rex)	0 ...	— ...	— ...	— ...	— ...	—	Retired second day broken connecting rod.
A. D. Draper (3½ h.p. Matchless)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent, same tyres throughout, no replacements or renewals.
A. M. Tatham (3½ h.p. Matchless)	0 ...	0 ...	0 ...	0 ...	— ...	—	Retired fifth day. Broke exhaust valve, replaced at Crewe, failed to take corner after Macclesfield through failure of exhaust lifter. Collided with wall and retired.
C. Williams (3½ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent, magneto shield effective. Tyres, Clincher at first; bead of rear tyre came away last day. Changed to Palmer, one puncture. Used Shamrock and Stanley belts, latter for low gear.
G. H. Lake (3½ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent throughout. Cowey indicator satisfactory and useful. Clincher tyres gave no trouble.
W. Douglas (2¾ h.p. Douglas)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition very good. Two Stanley belts used alternately. Rubber pedals and footrests much worn. Machine has evidently seen much service. One puncture Shamrock non-skid tyres.
J. V. Robinson (2¾ h.p. Douglas)	0 ...	0 ...	— ...	— ...	— ...	—	Retired second day. Crankshaft broken through flaw.
P. Phillips (2¾ h.p. Douglas)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Used two Stanley belts alternately. R.O.M. tyres, no punctures. Ground exhaust valve once.
F. Dover (3½ h.p. Triumph)	116 ...	0 ...	0 ...	0 ...	0 ...	—	Retired sixth day.
W. O. Bentley (3½ h.p. Rex)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Same tyres throughout. No renewals.
F. G. Boddington ... (3½ h.p. Rex)	0 ...	0 ...	0 ...	17 ...	33 ...	14	Condition fair. Wheel and engine bearings a trifle slack. Replaced exhaust valve. Tyres Shamrock, no punctures. Used two Stanley belts which had seen service before the trials.
B. H. Davies (6 h.p. Advance)	0 ...	0 ...	0 ...	0 ...	— ...	—	Retired fifth day near Buxton. Broke pin in timing gear.
A. L. Ommamey (5 h.p. Rex)	9 ...	0 ...	10 ...	— ...	— ...	—	Retired fourth day. Seized piston.
H. Bevir (3½ h.p. L.M.C.)	0 ...	0 ...	7 ...	— ...	— ...	—	Retired fourth day. Timing gear trouble.
W. H. Wells (5 h.p. Indian)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent throughout. No renewals except new Michelin tyre fitted. Chains gave no trouble.
G. Lee-Evans (5 h.p. Indian)	0 ...	0 ...	0 ...	0 ...	0 ...	—	Retired sixth day. Seized piston near Cirencester.
W. Pratt (3½ h.p. P. and M.)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Chains unadjusted. Everything in good order.
R. Moore (3½ h.p. P. and M.)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Chains a trifle slack but untouched. Tyres Palmer Cord, one puncture.
W. Milnes (3½ h.p. P. and M.)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Chains unadjusted.
T. Canby (3½ h.p. P. and M.)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition very good. Mudguard bent through accident and lamp broken. Chains untouched. Cowey indicator, broken transmission. One puncture. Changed back cover Palmer.
R. M. Brice (3½ h.p. Brown)	0 ...	0 ...	0 ...	0 ...	— ...	—	Retired fifth day. Collided with wall when trying to avoid child shortly after leaving Shrewsbury.
J. Slaughter (3½ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Bent footrest, broke rear lamp and bracket, and damaged pedal through fall. Hub clutch in good order. Tyres Clincher. Two punctures. Used Dermatine belt, worn slightly.
J. T. Bashall (3½ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	70 ...	—	Retired sixth day. Broke engine-shaft ball race near Abingdon.
W. H. Bashall (6-7 h.p. Bat)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good. Lamp bracket and exhaust lifter broken through accident. R.O.M. tyres satisfactory. Shamrock belt 4-1 throughout. Right footrest bent contact with stone.
H. H. Bowen (6-7 h.p. Bat)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent throughout. Broke lamp bracket. R.O.M. tyres. No punctures. Two belts used. In good order.
A. G. Fenn (6 h.p. Bat)	7 ...	0 ...	0 ...	— ...	— ...	—	Retired third day. Fell and broke outside bearing through hitting rock.
T. H. Tessier (7 h.p. Bat)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent throughout. Same tyres used throughout.

The A.C.U. Trials : List of Marks Lost.

Rider and machine.	MARKS LOST.						REMARKS.*
	1st day.	2nd day.	3rd day.	4th day.	5th day.	6th day.	
W. Smith (2 h.p. Moto-Rêve)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good. Slight play in head and back wheel. Used two Watawata belts alternately. R.O.M. tyres. No punctures. Replaced two plugs and two inlet springs.
G. L. Fletcher (2 h.p. Moto-Rêve)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good. Front mudguard shaky, broken in collision. Also lamp glass. Tyres 2in. and 1 $\frac{3}{4}$ in. R.O.M. satisfactory. One puncture. Watawata belt used throughout. Gears 6 $\frac{1}{2}$ to 1 and 6 to 1.
G. L. Andrews (2 h.p. Moto-Rêve)	0 ...	0 ...	— ...	— ...	— ...	—	Retired third day. Timing gear spindle broken, stripped teeth of magneto drive.
A. J. Sproston (5 h.p. Rex)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good. No renewals. Same tyres used throughout
R. Lord (5 h.p. Rex and sidecar)	0 ...	0 ...	0 ...	86 ...	6 ...	—	Retired sixth day. Broken frame damaged by accident.
O. C. Godfrey (3 $\frac{1}{2}$ h.p. Rex)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good throughout. R.O.M. tyres satisfactory. Changed one old cover. No punctures.
F. Phillips (3 $\frac{1}{2}$ h.p. Scott)	0 ...	0 ...	— ...	— ...	— ...	—	Retired second day. Reported to have broken roller bearing on big end.
A. H. Ormerod (3 $\frac{1}{2}$ h.p. Scott)	— ...	— ...	— ...	— ...	— ...	—	Retired first day. Reported to have withdrawn through tyre troubles.
F. Southam (3 $\frac{1}{2}$ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Excellent condition throughout. Tyres Palmer Cord back, fabric front. No punctures. 1909 model.
R. W. Duke (3 $\frac{1}{2}$ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good, including lamps and mudguards. Continental tyres (changed front) satisfactory. No mechanical trouble. Stanley belt 4 to 1 and 5 $\frac{1}{2}$ to 1 for hills. Same machine used in End-to-end last year.
F. C. Mustard (3 $\frac{1}{2}$ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. No replacements.
J. O. M. Dixon (5 h.p. Vindec)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good. Tyres both Dunlops. Changed rear tyre first night and fitted R.O.M. No tyre troubles after first day. Gear 4 $\frac{1}{2}$ to 1 and 5 to 1 for hills. Two Shamrock Gloria belts. Quite satisfactory.
J. Holroyd (1 $\frac{1}{4}$ h.p. Motosacoche)	0 ...	0 ...	0 ...	121 ...	0 ...	0	General condition excellent. Slight play in front wheel. Same covers used all through. No punctures. No renewal.
J. F. Crundall (3 $\frac{1}{2}$ h.p. Humber)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Watawata belt. Tyres Dunlops.
F. Edmond (3 $\frac{1}{2}$ h.p. Humber, two-speed)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Tyres Dunlops. One puncture. Bent footboards. Damaged lamp and gear levers through fall. Used Watawata belt for general use, rubber belt for hills. Gears used 4 to 1, 8 to 1, 5 to 1, and 10 to 1.
A. V. Sumner (3 $\frac{1}{2}$ h.p. Humber, two-speed)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Belts Watawata and Stanley used alternately. Footboards slightly damaged and lamp dented through fall. No punctures, nail catcher fitted.
O. Parker (3 $\frac{1}{2}$ h.p. Humber)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good. Play in both wheels. Front brake broken, frayed by lamp being loose. Pedal and crank bearing loose. Tyres Dunlop front, Palmer back. Latter changed first day. Two Watawata belts, short one used for hill-climbs.
P. J. Evans (3 $\frac{1}{2}$ h.p. Humber)	0 ...	0 ...	11 ...	0 ...	0 ...	0	Condition excellent. Tyres R.O.M. One puncture. Belts, rubber in good order, Watawata little used. Broke lamp and generator in accident.
F. C. Wood (4 h.p. N.S.U.)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Machine and engine fairly clean. Condition including gear excellent. Top gear 4 $\frac{1}{4}$ to 1. Reduction 33 $\frac{1}{3}$.
W. F. Newsome (3 $\frac{1}{2}$ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent throughout. Tyres Dunlops. No trouble. Used one Stanley belt. Gears used 4 $\frac{1}{4}$ and 5 to 1.
J. Marshall (3 $\frac{1}{2}$ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent throughout. Machine and engine very clean. Tyres Dunlops. Treads almost as new. Two punctures. Gears used 4 and 4 $\frac{3}{4}$ to 1. Two belts used to alter gear.
G. Gibson (3 $\frac{1}{2}$ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Machine fairly clean. Engine oily. Tyres Dunlops satisfactory. One puncture. Condition excellent.
H. Berwick (3 $\frac{1}{2}$ h.p. Excelsior)	0 ...	0 ...	0 ...	0 ...	0 ...	—	Retired sixth day. Broken connecting rod near Worcester.
H. D. Teage (3 $\frac{3}{4}$ h.p. Premier)	0 ...	0 ...	11 ...	— ...	— ...	—	Retired fourth day. Tank trouble.
G. E. Stanley (3 $\frac{1}{2}$ h.p. Premier)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition very good. Tyres Dunlops satisfactory. One puncture. Side play in crankshaft bearings.
R. W. Walker (3 $\frac{1}{2}$ h.p. Premier)	34 ...	0 ...	— ...	— ...	— ...	—	Retired third day. Tank trouble.

The A.C.U. Trials : List of Marks Lost.—

Rider and machine.	MARKS LOST.						REMARKS.*
	1st day.	2nd day.	3rd day.	4th day.	5th day.	6th day.	
A. Weatherilt (3½ h.p. Zenette)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good. Lamp bracket broken. Front wheel loose. One side of carrier broken. Front brake shoe missing. Front tyre Continental renewed.
F. W. Barnes (3½ h.p. Zenith)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. New Shamrock tyre fitted to back wheel.
J. W. Morris (3½ h.p. Bradbury)	0 ...	0 ...	0 ...	0 ...	0 ...	6	Condition good. Generator clip broken. Front mudguard fastening broken. Same tyres used throughout.
G. Simpson (3½ h.p. Bradbury)	0 ...	0 ...	189 ...	15 ...	0 ...	9	Condition fair. Lamp missing, bracket broken, rear wheel loose, front fork broken. Same tyres throughout. Bent footrests through fall.
P. Platt (3½ h.p. Bradbury)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition fair. Broken oil pipe. Front fixing of tank broken, reputed through accident. Tyres Clinchers. Two punctures. Used two Lycett belts, one for low, other for high gear.
J. Eastwood (3½ h.p. Bradbury)	0 ...	0 ...	0 ...	0 ...	0 ...	9	Condition good. Engine oily. Magneto chain broke. Tyres Clincher-Dreadnoughts. No punctures. Used two Lycett belts
A. T. Stanton (3½ h.p. Bradbury)	178 ...	— ...	— ...	— ...	— ...	—	Retired second day. Seized engine through bad oil. Tin reported to have been filled with varnish.
G. E. Carrow (3½ h.p. T.T. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. New front tyre (Dunlop) fitted. No renewals.
R. King (3½ h.p. Triumph)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Machine dirty, engine oily, otherwise condition good. Palmer tyres excellent. Both rims dented through stones. Broke exhaust valve. Gears 4½ to 1 and 5¼ to 1. Free engine, useful on level but not on hills.
F. S. Barnwell (3½ h.p. Triumph, Roc two-speed gear)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good. Play in back wheel. Slight petrol pipe broken (reported before trial). Palmer cord tyres. Two punctures. One Shamrock belt untouched.
T. Woodman (7 h.p. V.S.)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good. Nut broken on carrier. Tyres Peter Union untouched throughout. Belt changed last day, fastener broke.
S. Osborne (3½ h.p. Osborne)	0 ...	35 ...	— ...	— ...	— ...	—	Retired third day. Petrol union came unsoldered from tank near Devil's Bridge.
H. B. Lewis (3½ h.p. Triumph)	0 ...	12 ...	0 ...	0 ...	0 ...	0	Condition very good. Broke exhaust valve. Bent pedal spindle and footrest through fall. Tyres Dunlops. Three punctures. Used two Shamrock belts, one going at fastener.
R. Fletcher (3½ h.p. Premier)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition good. Spring fork joints somewhat worn. Used two Shamrock belts and one Watawata, latter in good order. Tyres Continental front, R.O.M. back. One puncture.
Rev. B. Aston (3½ h.p. Triumph, 1907 model)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Front brake broken. Changed exhaust valve and plug as a precaution. Used Shamrock-Gloria belt for a few miles and Stanley for remainder. Tyres Dunlop front, no punctures. Palmer back, four nail punctures. Used Rich tubes.
A. Baker (1½ h.p. Wolf)	173 ...	98 ...	— ...	— ...	— ...	—	Retired third day. Ran into wall and buckled wheel.
A. J. Stevens (3 h.p. Wolf)	0 ...	0 ...	0 ...	0 ...	0 ...	0	Condition excellent. Small pin missing out of exhaust lift lever. New footrests and pedals fitted. Same tyres used all through. Stand loose.
P. E. Tolfree (5 h.p. Roc and sidecar)	0 ...	0 ...	— ...	— ...	— ...	—	Retired third day. Broken frame.
J. Miller (4 h.p. Zenith and sidecar)	0 ...	0 ...	29 ...	0 ...	† ...	‡	Ran into hedge on taking corner at Hankelow. Back mudguard broken. Back brake rod bent but brake working. Levers and fittings much knocked about. Sidecar body broken. Cowey indicator broken. Silencer wired on. Used two Stanley belts, one worn out other in fair order. Tyre Peter Union on sidecar wheel good, used Continental tyre first day. Clincher tyre front in good order, rear Clincher changed to R.O.M., which is unevenly worn. Broken petrol pipe.
W. Pershke (6 h.p. Puch and sidecar)	0 ...	0 ...	0 ...	— ...	— ...	—	Retired fourth day. Accidentally damaged armature of magneto.

*For the extremely useful and interesting remarks mentioned after each machine we are indebted to the judges, Messrs. Cove, Brooker, and Reynolds, who kindly placed their notebooks at our disposal, from which these notes are taken.

† No record. ‡ Lost all marks.

N.S.U.

Six days' A.C.U. Reliability Trial.

The 4½ h.p. Single Cylinder (fitted with 2-speed gears)
N.S.U. Model de Luxe gained full marks on running time and made fine performances on the severest hills.

When comparing this performance it must be remembered that this machine was the only N.S.U. entered, and was driven by a private owner—Mr. F. C. Woods.

**HERTFORDSHIRE COUNTY A.C. HILL CLIMB.
CLASS--C.**

N.S.U. 3½ h.p. Twin FIRST.

Ridden by a private owner.—Mr. Leslie Munro.

The End-to-end Record Again Beaten.

EVER since the early days of record-breaking, whether on cycle or motor cycle, record rides have been made like pie crusts, only to be broken. If there is a record which is more classical than another it is the End-to-end, embracing as it does all descriptions of road in England and Scotland. What took the A.C.U. competitors six days to accomplish last year has just been covered in 33h. 22m. by Mr. Ivan B. Hart-Davies, of Bank Street, Rugby, a member of the Coventry and Warwickshire Motor Club, and a most enthusiastic rider of a Triumph motor bicycle. Mr. Hart-Davies has had his eye on this record for the past two or three years, and has been steadily preparing himself for the event this year by competing in several long distance rides, besides lengthy tours in company with other Midland motor cyclists who favour long distance riding. The other day an urgent telephone message was received at our offices from Mr. Hart-Davies asking us to meet him in Coventry and seal the motor bicycle which he intended to use in the ride. This was a $3\frac{1}{2}$ h.p. touring Triumph fitted with pedalling gear, Dunlop tyres and tubes, and Stanley Derma-line belt. It was fitted with a larger petrol tank than usual for long non-stop runs, which proved very useful in Scotland. We sealed the cylinder to the seat tube in such a manner that it was impossible to remove the cylinder from the crank case without breaking the seal. We also noted the number of the frame and engine. Having done this, we wished Mr. Hart-Davies the best of luck, and awaited news from the starting point. This was not long coming.

On Monday, 12th inst., Mr. J. J. Robertson, of Wick, N.B., wrote that Mr. Hart-Davies left John-o'-Groat's that morning at three, and confirmed the seal on the engine and frame, also number of engine. The next message we received was to the effect that the rider was several hours ahead of his schedule time at Lanark. Messages were also received at our office from Gloucester and Exeter, both of which confirmed the rapid progress of the record breaker. On the 13th inst. at 2.30 p.m. we received the following wire from Land's End: "Beat record by 7h. 16m. Fly time 33h. 22m.—HART-DAVIES." This has since been confirmed by Messrs. Holman and Sons, Ltd., of Penzance, who timed the rider at Land's End on Tuesday afternoon, July 13th, at 12.22, and confirmed the number of engine, and stated that seals were intact. The timekeeper had taken the precaution of getting his watch certified as correct by a local watchmaker, Mr. J. Bennett, who was on the spot at the time of his arrival. Mr. V. T. Paull (*Daily Mirror*) was also present. Mr. Hart-Davies's time beats the previous best by 7h. 16m., the old record being accomplished by Mr. T. Peck, of Birmingham,

on May 24-25th, when he covered the total distance in 40h. 38m. The following times of arrival and departure will give some idea of the rider's progress: Monday, July 12th.—Left John-o'-Groat's 3 a.m.; arrived Perth 12.17 p.m.; left 12.37 p.m.; arrived Lanark 3 p.m.; arrived Lockerbie 4.36 p.m.; left 4.51 p.m.; arrived Wigan 9.30 p.m.; left 10 p.m. Tuesday, July 13th.—Arrived Gloucester

3.20 a.m.; left 3.40 a.m.; arrived Exeter 7.50 a.m.; left 8.5 a.m.; arrived Land's End 12.22 p.m.

Last Thursday Mr. Hart-Davies called at our office for us to examine the seals we had placed on his machine. These we found intact. We also checked the number of the machine and frame, and took the opportunity of weighing the rider, who turned the scales at 14 stone 2 lbs. in riding trim. His machine, loaded with spare belt, two tool bags, lamp and generator, and half full of petrol and oil, weighed exactly 196 lbs.

Mr. Davies informed us that his Dunlop tyres behaved well throughout, but he had to change one cover at Perth, owing to its being cut. He particularly wishes to thank those riders who assisted him as followers, and would specially like to mention the following names: Messrs. Hugh Gibson, Dr. O'Rafferty, F. C. Mustard, Rupert May, and

Adamson (of Perth). Mr. Hugh Gibson rode from Garstang to Land's End with Hart-Davies, and Mr. Rupert May saved the situation, we are told, as without his assistance between Tarporley and Wellington the record breaker thinks he would have missed his way, owing to the numerous turnings. Readers will remember that Mr. A. W. Bentley lost the road at this point in 1908, and from our own experience of the district it requires an intimate knowledge of the route to avoid dismounts. Hart-Davies says it is impossible to thank everybody personally, but he particularly wishes to mention the kindness and interest shown in the performance by the proprietor of the Bell Hotel, Gloucester, who not only sat up to see that the rider's comfort was attended to, but wrote him afterwards and congratulated him upon the performance. The ride, we understand, was full of incidents, but as pressure on our space is very great this week, owing to the results of the A.C.U. Trials, we are compelled to give rather a brief outline of the performance, and in a subsequent issue Mr. Hart-Davies has promised to write us an account giving his own impressions of the End-to-end record.

The present End-to-end record holder, Ivan B. Hart-Davies.

Bradford M.C.C. Open Hill-climb.—

CLASS VI.—Racing singles up to 85 mm. bore.

1. F. Mackay ($3\frac{1}{2}$ h.p. Triumph) ... 27 $\frac{1}{2}$ s.
2. O. C. Godfrey ($3\frac{1}{2}$ h.p. Rex) ... 27 $\frac{3}{4}$ s.
3. G. E. Stanley ($3\frac{1}{2}$ h.p. Premier) ... 28 $\frac{1}{2}$ s.

Also competed: Somers (Speed King Rex), Fishwick ($3\frac{1}{2}$ h.p. Triumph), J. C. Smyth ($3\frac{1}{2}$ h.p. Rex), W. E. Grange ($3\frac{1}{2}$ h.p. Triumph), C. Wilson ($3\frac{1}{2}$ h.p. Rex), Cockcroft ($3\frac{1}{2}$ h.p. Triumph), H. D. Shaw ($3\frac{1}{2}$ h.p. Triumph), Hoffmann ($3\frac{1}{2}$ h.p. Triumph), and Moorhouse ($3\frac{1}{2}$ h.p. Triumph).

CLASS VII.—Racing twins up to 76 mm. bore.

1. J. Scriven (5 h.p. Rex) ... 25 $\frac{4}{5}$ s.
2. F. C. Bagshawe (5 h.p. Rex) ... 28 $\frac{4}{5}$ s.
3. L. Obank (5 $\frac{1}{2}$ h.p. N.S.U.) ... 29 $\frac{4}{5}$ s.

Also competed: H. E. Gerhartz (5 h.p. Vindec) and F. Scriven (5 h.p. Rex).

CLASS VIII.—Open to all.

1. W. H. Bashall (8 h.p. twin Bat); fastest time; trophy, a silver goblet ... 25s.
2. J. Scriven (5 h.p. twin Rex) ... 25 $\frac{2}{5}$ s.
3. O. C. Godfrey ($3\frac{1}{2}$ h.p. Rex) ... 26 $\frac{3}{5}$ s.
4. H. Reed (7-8 h.p. twin Dot) ... 27 $\frac{1}{5}$ s.
5. F. C. Bagshawe (5 h.p. twin Rex) ... 29 $\frac{4}{5}$ s.
6. O. Brooks (8 h.p. twin Buchet) ... 30 $\frac{2}{5}$ s.
7. H. Shaw ($3\frac{1}{2}$ h.p. Triumph) ... 30 $\frac{4}{5}$ s.
8. P. Cockcroft ($3\frac{1}{2}$ h.p. Triumph) ... 32 $\frac{4}{5}$ s.

The success of the competition is chiefly due to the trials hon. sec., Mr. Felix Scriven, who was supported by numerous club officials. The timekeepers were Messrs. Fattorini and Rhodes; starter, Mr. Johnson.

Although not entered for the competition, that much talked of motor bicycle the two-cylinder, two-stroke, two-speed Scott made an unofficial climb in fine style, and opened the eyes of the spectators later in the day by climbing the hill without a falter with an extra passenger seated on the back carrier. The purr of its sweet running engine was quite a pleasant change from the jerky, not to mention noisy, explosions of most of the competitors' machines.

Scottish Five Days' Open Reliability Trial.

THE START ON MONDAY LAST.

BY B. H. DAVIES.

THE Edinburgh Motor Cycling Club deserves hearty congratulations upon the scheme and organisation of its trial. The competition will resemble a pleasure tour more than any previous competition, as there are only two checks a day, apart from meals, one in the morning and one in the afternoon. Nevertheless, it will be the severest motor cycling trial ever held, thanks to the surface of the roads, the severity of the gradients, and the head winds, and I have little hesitation in prophesying that only half a dozen machines are likely to come through with full marks. At the start on Monday last a strong wind was blowing from the north. Amulree, Grampians, Berriedale, and Ord have to be climbed, yet the Advance is the only two-speed machine. Some have not even got adjustable pulleys. The weather at the start was bright and windy, but fleecy clouds threatened rain when the official car left for Amulree. Six of those competitors given on page 544 did not register as starters, viz., Muirhead, Moodie, Baxter, Niven, Kennedy, and Gilmour.

The first day's route was the hardest. Amulree at sixty-seven miles, Grampians after lunch, 186 $\frac{1}{2}$ miles altogether against headwind. The Grampians are in a badly cut up condition. The route for to-day (Wednesday) was altered to go over the steep two miles' gradient from Bonar to Alness. Route finding is well provided for by arrows; also each competitor receives direction card daily.

[Next week a description of the trial will appear in *The Motor Cycle*, written by Mr. B. H. Davies, who is accompanying the competitors to John-o'-Groat's.]

IRISH END-TO-END RELIABILITY TRIAL.

THIS important contest under the auspices of the Ulster Centre of the Motor Cycle Union of Ireland took place on the 13th inst. and proved most successful, sixteen reaching the starting point. Rain was falling heavily at the start, and to add to the discomfort of the competitors a heavy fog lay over the district which made it very difficult to find the way. Punctually at 1 a.m. the following riders were despatched: J. Stewart, Belfast, $3\frac{1}{2}$ h.p. Triumph; C. E. Murphy, Cowtehill, $3\frac{1}{2}$ h.p. Triumph; J. J. Kennedy, Belfast, $3\frac{1}{2}$ h.p. Bradbury; J. Lavery, Belfast, $3\frac{1}{2}$ h.p. Triumph; J. Coulter, Armagh, $3\frac{1}{2}$ h.p. Triumph; R. M. Talbot, Portarlinton, $3\frac{1}{2}$ h.p. Triumph; F. A. Wallen, Dublin, $3\frac{1}{2}$ h.p. Triumph; C. B. Franklin, Dublin, $3\frac{1}{2}$ h.p. Triumph; T. A. Govan, Dublin, $3\frac{1}{2}$ h.p. Triumph; W. H. Humphries, Armagh, $3\frac{1}{2}$ h.p. Humber; J. Healy, Dublin, 5 h.p. twin Peugeot; W. T. Hughes, Graigue, $3\frac{1}{2}$ h.p. Triumph; J. E. Coulter, Belfast, $3\frac{1}{2}$ h.p. Triumph; M. J. Lindsay, Belfast, $3\frac{1}{2}$ h.p. Triumph; J. M. Kennedy, Ballymena, $3\frac{1}{2}$ h.p. Rex. W. J. Andrews, Belfast, $3\frac{1}{2}$ h.p. Rex, did not reach the starting point until an hour after the others had left, and he was started alone.

The unfavourable atmospheric conditions at the start proved most trying to the riders, falls being numerous and punctures plentiful. The first checking station was at Cork (78 miles), which was due to be reached at 4.54 a.m., but with tyre troubles and difficulty in finding the way a considerable number of the riders were late in arriving. Six, however, secured full marks, their names being C. E. Murphy, J. Lavery, J. Coulter, R. M. Talbot, C. B. Franklin, and T. A. Govan. Better weather conditions prevailed after Cork was passed, although the roads were very rough. The second check was at Cashel (138 miles), and here again the six riders mentioned above had full marks. Of the others, only J. Stewart, J. J. Kennedy, J. E. Coulter, and J. M. Kennedy arrived later. The remainder retired. The first section of the ride ended at Dublin (235 miles), the schedule time of

arrival being 12.45 p.m. At this control ten riders arrived on time. A stop of one hour was made for luncheon, and at 1.45 p.m. the second section of the journey was begun. Checks were arranged at Drogheda, Newry, and Belfast, at all of which full marks were gained, but J. E. Coulter retired at Belfast. The remaining nine riders kept together for the remainder of the trial, and finished at Fair Head (395 miles) prompt to time—9.45 p.m. On examining the check books it was found that six riders had received the maximum number of marks (70), viz., C. E. Murphy, J. Lavery, C. B. Franklin, R. M. Talbot, T. A. Govan, and J. Coulter. A hill-climb was accordingly held on Wednesday morning to decide the winner—the machines having been locked up overnight. The times recorded were: C. E. Murphy, 39 $\frac{4}{5}$ s.; C. B. Franklin, 52s.; J. Lavery, 52 $\frac{4}{5}$ s.; and T. A. Govan, 55s. R. M. Talbot and Coulter were unsuccessful at the first attempt, but afterwards made the ascent. The formula for this part of the contest was time in secs. \times cylinder capacity and divided by the combined weight of rider and machine, and worked out as follows:

- | | | | | |
|-------------------|-----|-----|-----|--------------|
| 1. C. E. Murphy | ... | ... | ... | 51.06 points |
| 2. J. Lavery | ... | ... | ... | 62.99 " |
| 3. T. A. Govan | ... | ... | ... | 69.81 " |
| 4. C. B. Franklin | ... | ... | ... | 72.58 " |

Talbot was placed fifth and Coulter sixth.

The special gold medal presented by *The Motor Cycle* was won by C. E. Murphy, and the gold medal presented by the R.O.M. Tyre and Rubber Co. was won by J. Lavery. J. Stewart, J. J. Kennedy, J. M. Kennedy, and M. J. Lindsay will receive certificates.

Mr. P. Moffatt has been declared winner of the Palmer cup and medal in the A.C.U. London to Plymouth and back twenty-four hours' run, June 11th and 12th. He rode a $3\frac{1}{2}$ h.p. Triumph.

MOTOR CYCLING CLUB.

TWENTY-FOUR HOURS' RELIABILITY TRIAL FOR MOTOR BICYCLES.

THE M.C.C., always anxious to promote trials and competitions suitable for all its members, held on Friday and Saturday last a twenty-four hours' reliability trial for motor bicycles only. The general principle of the trial was reliability and regularity of running to a scheduled speed of nineteen miles an hour. Exactly four hours were

The M.C.C. officials—F. T. Bidlake, timekeeper (centre), W. H. Wells (left), and Dr. C. Gibbons (right).

allowed for each round of the course (Taplow-Oxford-Taplow), which was covered six times, making a total distance of 450 miles. Timekeepers were stationed at Taplow and Oxford. F. T. Bidlake held the watch at Taplow (the Dumb Bell), and the clocking and checking arrangements at Oxford were in the hands of the Oxford M.C.C. One mark was lost for every quarter of a minute early or late of schedule time. The awards were a silver cup to the winner (presented by F. J. Jenkins and W. H. Wells), three special gold medals to the three best performances by private owners, and club gold medals to every competitor completing the full distance in twenty-four hours.

The course for the first three journeys was Taplow, High Wycombe, Wheatley, Oxford, Dorchester, Henley, Maidenhead, and Taplow, and for the last three journeys outward *via* Maidenhead and Henley, and homeward *via* Beaconsfield. As these courses comprised the ascent of Dashwood and Stokenchurch Hills thrice, it was a fairly stiff task without counting the necessity of keeping as nearly as possible to schedule time.

The bad weather on Friday morning obviously stopped many competitors from turning up at the start, though could they have seen the state of the Bath Road even at noon on Friday they might possibly have altered their minds, for with a nice breeze blowing the road surface was quite dry.

At the Start (8 p.m. Friday).

Mr. Harris, whose garage is opposite the Dumb Bell on the Bath Road, rendered great assistance by fitting some powerful acetylene gas lamps outside his premises. These greatly aided the officials during

the dark hours of the night. He also had a staff of men ready with petrol and other necessities all through the competition.

The entries numbered thirty-seven, and twenty-one actually started as follows:

Hugh Gibson (3½ Triumph).	H. Davison (3½ Rex).
J. L. Barratt (5-6 Chater-Lea-Peugeot).	W. Cooper (3½ Triumph).
G. Purchase (3½ Triumph).	Stanley Webb (3½ Triumph).
H. Karslake (3½ own make).	W. Smith (5 V.S.).
J. S. Spencer (3½ Triumph).	G. Brough (5 Brough).
C. C. Cooke (3½ Triumph).	A. J. Stevens (3 Wolf).
E. Clark (2¾ Douglas).	W. Price (3½ Rex).
E. Pond (5 V.S.).	F. G. Smith (3½ Triumph).
E. Cherry (3½ Triumph).	A. G. Forbes (¾ Triumph).
C. Burton (3½ Vindec-Special).	P. Janson (3½ Bat).
	J. W. Robinson (2¾ Douglas).

The only alteration from the official programme was that W. Smith, usually seen on a Moto-Rêve, was riding W. Mead's 5 h.p. V.S. Unfortunately for Smith, he met with an accident during the first round at Wheatley, was somewhat cut about, and had to retire. Spencer fell out in the first round (cause unknown), Cherry, Janson, and Purchase dropped out in the second round, and Cooper retired four and a half miles from Oxford. F. G. Smith, who lost his way in the first round, ran out of petrol, arrived late, and suffered a loss of sixty-three marks, wanted to retire but was persuaded to go on. Afterwards his performance was a most consistent one, and he was the only rider to complete three rounds without any loss of marks. The next best was H. Gibson, fourth and sixth rounds without loss of marks. Karslake lost no marks on the sixth round, and completed two other rounds with a loss of only one mark each. Pond, Price, and Brough covered one round without loss of marks. When one considers that only a quarter of a minute early or late meant one mark lost, the performances were excellent.

Eli Clark (2¾ h.p. Douglas) on the Bath Road. This rider suffered a collision in the fifth round, and although he only lost sixteen marks in the first four rounds, he could not complete the sixth and had to retire. The cars in the background are on their way to the Maidenhead regatta.

Stanley Webb, who arrived from the wrong direction at the end of the fifth round, had to retrace his steps. His error cost forty marks.

Motor Cycling Club.—

Towards the completion of the fifth round the timing showed that, barring accidents, Karslake or Hugh Gibson would win the cup, with Brough as runner-up. Karslake eventually won, and he and Gibson shook hands heartily at the close of the event. The positions were:

	Marks lost.		Marks lost.
H. Karslake	... 21	*F. G. Smith	... 86
*Hugh Gibson	... 24	Stanley Webb	... 138
G. Brough	... 26	*J. L. Barratt	... 230
A. J. Stevens	... 53	*C. C. Cooke	... 344
*W. Price	... 69	*A. G. Forbes	... 393
E. Pond	... 72	*C. Burton	... 963
*H. Davison	... 84		

* Private owners.

The winners of the private owners' medals presented by E. Gwynne and C. J. Seed are therefore (subject to revision by the committee) Gibson, Davison, and Price.

Karslake's own make has a De Dion engine, with the radiators drilled through all over, Amac carburetter, footboards, N.S.U. two-speed gear on engine-shaft, Whittle belt, no pedals, and a special spring seat, which, although not beautiful, is doubtless comfortable. The win is all the more creditable, as he was competing against some of the best and most up-to-date machines of the day. Burton's back tyre was cut nearly through; it was a marvel he completed the journey. Two or three had spare tanks on the top tube or handle-bars, and mascots were conspicuous by their absence, thank goodness.

In addition to the officials already mentioned, R. H. Head and F. J. Jenkins patrolled the course in a car, and E. B. Dickson (the captain of the club) and Dr. C. Gibbons were also in evidence. Harry G. Bell, the trials hon. secretary, informed us that nearly all the competitors were satisfied with their day's sport. The thanks of the club are due to the Oxford M.C.C., Mr. W. Mann (Service Co., Ltd.), and the A.A.

The Motor Union Speed Trials.

IN connection with the visit of the Motor Union and the Ligue Internationale des Associations Touristes to Wales, speed trials were held on the 16th inst. on Pendine Sands, forty-five miles west of Swansea. These sands form an ideal course for motor speed trials, extending for many miles with a smooth, hard, level surface. The course was carefully marked out for a distance of about two miles by a wire fence, which was lined by the public, who had turned out in thousands. The first event was for motor bicycles with cylinders having a capacity of over 300 and not exceeding 601 cubic centimetres. The entrants were as follows:

J. S. Andrew (Triumph)	... 82 × 86	... 454 c.c.
A. W. Gemmill (Rip)	... 82½ × 82½	... 441 "
W. E. James (Oxford)	... 82 × 90	... 475 "
L. E. Jenkins (Phelon and Moore)	... 82 × 88	... 465 "
J. C. Moore (Rex)	... 82½ × 89	... 475 "
E. T. Strick (N.S.U.)	... 80 × 80	... 402 "
J. Sullivan (Triumph)	... 84 × 86	... 477 "
W. Pollard (Quadrant)	... 81 × 88	... 453 "
W. Jones (Quadrant)	... 84 × 88	... 487 "

Mr. Pollard was first past the winning post, but was disqualified, the judges ruling that his machine was not of a standard touring type, the rules requiring all motor cycles to be touring roadsters. The cup presented by the motor cycle committee of the M.U., together with a medal, were accordingly awarded to the second past the post, Mr. W. E. James; the second prize, the M.U. medal, going to Mr. E. T. Strick.

The second event for motor bicycles with cylinders of unrestricted capacity was a walk over for Mr. Pollard, Mr. E. James (who had entered a twin-cylinder Griffon) being a non-starter.

CLUB NEWS.

Manchester M.C.

The first speed judgment test of 1909 took place on Saturday last on the Warrington roads. The speed fixed upon was twenty miles an hour. A fair number competed. C. E. Kettle, on a 3½ h.p. T.T. Triumph, proved the winner of the motor cycle section, his time being only 35s. too fast.

Leeds M.C.C.

The annual reliability trial, Leeds to London and back, was held by the Leeds M.C.C. on Saturday, the 10th inst., for an invitation shield, value fifty guineas, to be held for one year by the winner. Other awards in connection with the event were three gold medals for the first three who lost the least number of points, and a bronze medal for all riders who completed the journey within schedule time. This year there was a special provision made for private owners, a gold medal being given to the first private owner who, not being one of the first three, had qualified for a bronze medal.

There were thirty-five entries, including representatives from the Manchester, West Hartlepool, Bradford, and York County clubs, the majority of whom started from the Star and Garter Hotel, Kirkstall. The weather at the start, and throughout the journey was anything but pleasant, drenching rain and bad roads being experienced during practically the whole of the run. The official result was declared as follows: 1, T. Bullus (P. and M.); 2, F. Scriven (Rex); 3, — Sydney (—). Reed, Kettle, Hamilton, Walton, Cockcroft, and Smith also completed the journey.

The Motor Cycling Club.

The London to Land's End and back competition for the Jarrott cup is to be held on Saturday and Monday, July 31st and August 2nd, starting from Cranford Bridge, near Hounslow. The competition is for motor bicycles only. The winner will be the competitor whose time taken at

Competitors in the Irish End-to-end Reliability Trial. The winner, C. E. Murphy (3½ h.p. Triumph) is at the extreme left.

secret controls over three stretches of thirty miles both on the outward and return journey most nearly agrees with his schedule time. The route will be Cranford Bridge, Staines, Basingstoke, Andover, Salisbury, Shaftesbury, Sherborne, Yeovil, Crewkerne, Chard, Honiton, Exeter, Okehampton, Blue Anchor, Mitchell, Redruth, Penzance, Land's End, and back to Penzance. Return—Penzance, and continue eastwards *via* Redruth, Mitchell, and the route as above in reverse direction. Entries should be sent, together with entrance fee (£1 1s.), to reach the trials hon. sec., Mr H. G. Bell, 52, Station Road, Finchley, N., on or before the first post on Saturday next.

Club News.—

Shropshire M.C.C.

The first competition held by the above club took the form of a petrol consumption test. The results were: Mr. G. Benham, first, Mr. H. G. Potts second, and Mr. T. W. Shaw third. The winner's mileage was 178 miles to the gallon.

Nottingham and District M.C.C.

The Dennis-Bayley challenge cup competition, which takes the form of a 100 miles non-stop reliability run, will be run off on Saturday next. A petrol consumption test has been arranged for August 14th. Runs recently arranged include journeys to the Dukeries, Dovedale, Woodhouse Eaves, Lincoln, Wansford, Barnby Moor, Evesham, Leamington, etc.

Essex M.C.

The members' hill-climb takes place on Saturday afternoon next at Lippetts Hill, High Beech, entries for which may be sent in up to to-morrow (Thursday) morning to the hon. sec., Mr. Harold Fuller, Wynndale Road, Woodford. There are five classes, viz., single-cylinder, multiple cylinder, lightweight, passenger motor cycles, and cars. The competition starts at 3.30 sharp. A picnic tea on the hill has been arranged for after the climb. Each competitor will be allowed two runs up, the fastest to count. Three prizes will be given in each class, provided that there are sufficient entries, and a silver medal for fastest time of the day. The hill is in good condition, and some fast times are expected. On the following day (Sunday) there is to be a breakfast run to Cambridge, particulars of which may be obtained from the captain at the hill-climb.

Coventry and Warwickshire M.C.

It is interesting to know that a member of the Coventry and Warwickshire M.C. holds the End-to-end record, and another member won the 1908 Tourist Trophy Race. The former record has just been beaten by I. B. Hart-Davies, of Rugby, while everyone knows that J. Marshall, of Coventry, finished first in the T.T. Race last year.

Worcestershire M.C.C.

A petrol consumption trial was held on the 10th inst., the course being from headquarters to Pershore. Each competitor was allowed one gallon of petrol, and the results, subject to confirmation, are as follows:

Rider and machine.	Petrol used.
T. Smith (3½ h.p. Rex) ...	15½ ozs.
H. J. Heaven (3½ h.p. Triumph) ...	16 ozs.
H. C. Pickering (2¾ h.p. Rex) ...	15¾ ozs.
A. G. Bryant (3½ h.p. Triumph) ...	20 ozs.
L. T. Baylis (3½ h.p. Corah) ...	24 ozs.
H. T. Clark (3½ h.p. Humber) ...	43 ozs.

A remarkable point about this competition is that the first three averaged slightly over 220 miles per gallon. This probably is a record, although it must be mentioned that there was a strong wind blowing at the back of the competitors all the way.

North-west London M.C.C.

The annual hill-climb was held on the 3rd inst., the venue being Cop Hill, Princes Risboro'. The selected hill proved an excellent test, being minus any bad corners, half a mile in length, and with an average gradient of 1 in 9, the steepest pitch being near the top. The surface was in very fair condition, having been carefully swept beforehand. The results, on A.C.U. formula, subject to being passed by the committee, are as follows:

CLASS I.—Single-cylinder machines, any capacity.

Rider and machine.	Time.	Fig. of Merit.
E. A. Colliver (3½ h.p. Triumph)...	+ 4¾s.	2.517
A. W. Bentley (3½ h.p. Triumph)...	X	2.446
W. O. Bentley (3½ h.p. Rex) ...	+ 7½s.	2.437
J. P. Le Grand (3½ h.p. Rex) ...	+ 13s.	2.184

CLASS II.—Multi-cylinder machines, any capacity.

Glyn Rowden (8 h.p. Bat) ...	X	6.619
S. R. Tyssen (5 h.p. Vindec) ...	+ 9¾s.	4.181
Miles Brunton (5 h.p. Rex) ...	+ 27s.	3.684
A. Brunton (5 h.p. Rex) ...	+ 32¾s.	3.099
C. M. Simpson (5 h.p. Vindec) ...	+ 20¾s.	3.088
A. S. Phillips (5 V.S.) ...	+ 27¾s.	2.887

A picnic lunch was held the day after at Burnham Beeches.

Members are reminded that the petrol consumption trial is on Saturday next, the 17th inst. The committee would be glad if any member who is not competing would act as marshal, and send in his name to the trial hon. sec., Mr. G. H. Hollis, 7, Melrose Avenue, Cricklewood, N.W.

Eastern District M.C.

On August 8th a 100 miles reliability trial will be run for the trophy which the president, Mr. F. Leverton Harris, M.P., presented to the club. Mr. J. Babbage, the hon. auditor, has very kindly promised to give a prize for the member running second to the winner of the trophy.

Lincolnshire M.C.C.

The Palmer cup competition on the 24th inst. will consist of a reliability run, the selected circular course being from Wragby to Horncastle, via Cawkwell to Louth, via Brough to Wragby, about thirty-eight miles, to be covered three times. The start will take place from Wragby at 10 a.m., and the competitors will be sent off at one minute intervals.

At the Grimsthorpe speed trials on August 21st the course will be an undulating one, about a mile in length. The classification of machines will be as follows: Class I., lightweights, not exceeding 120 lbs.; Class II., single-cylinder machines, with a cubical capacity not exceeding 500 c.c.; Class III., twin and multi-cylinders, any capacity. The club has accepted the invitation of one of its members to tea at the Five Bells Hotel, Edenham, after the trial.

The results of the hill-climb at Bully Hill, Tealby, have now been announced. Hayhurst made fastest ascent of the day on his 6 h.p. N.S.U., and the placings on formula are as follows:

SINGLE-CYLINDER CLASS.

Rider and machine.	Time.	Fig. of merit.
1. J. Manners Smith (3½ h.p. Triumph) ...	X	20.48
2. E. R. White (3½ h.p. Premier) ...	8½s.	20.35
3. T. S. Middlefell (3½ h.p. Triumph) ...	15s.	18.15

MULTI-CYLINDER CLASS.

1. H. Hayhurst (6 h.p. N.S.U.) ...	X	21.05
2. G. Nicholls (4½ h.p. F.N.) ...	20s.	18.34
3. S. G. Clarke (5 h.p. Rex) ...	3¾s.	17.52
4. F. Richardson (5 h.p. Vindec) ...	13s.	17.4
5. J. Mawd (5 h.p. F.N.) ...	26s.	15.4
6. C. Moore (5 h.p. Rex) ...	22s.	15.1
7. Dr. Gratz (5 h.p. F.N.) ...	38¾s.	14.2
8. G. James (4½ h.p. Minerva) ...	} Failed to complete course.	
9. A. Fox (5 h.p. F.N.) ...		

X represents fastest time in each class, and other times record seconds slower than X.

The winner of the All-comers' Handicap at Brooklands last week, H. H. Bowen (3½ h.p. Bat-J.A.P.), speed 62½ m.p.h. He also established new class records later in the day.

A. G. Reynolds, one of the Judges in the A.C.U. Six Days' Reliability Trials. He rode a 1909 two-speed Humber, which carried him faithfully and well until the fourth day, when he was unfortunately run into by another motor cyclist and injured.

ALWAYS made it my endeavour to be numbered among those who practise what they preach, but for once, at any rate, I have proved a traitor. I always advise entrants in trials to ride a machine they know, no matter how shabby and travel-stained it be. This year I entered in the 1,000 miles with a machine which was practically only finished the day before, though I had ridden it a good distance in a more or less incomplete condition. How I paid the penalty you shall hear.

I left the machine at Uxbridge on Saturday, July 17th, asking Wells to see it sealed and numbered for me, and when I returned on the Sunday night he led me to it with a rueful countenance, and solemnly pointed to two large pieces of black tin wired to it, each carrying the fateful number "13," to which he had added " $\frac{1}{2}$ " in pencil. The ill-luck was not long coming, for I found I had been allotted a bed in a parlour, where some thirty choice spirits intended to pass the night. However, as a long tramp through Uxbridge secured me more comfortable quarters, I decided the omens were not insuperable, and started on the Monday in high hopes, the more so because the machine had never once met with a stoppage of any sort, or struck a hill it could not climb at very high speed if desired. Being geared $3\frac{1}{2}$ to 1, I soon found my chief difficulty was to keep down the pace to the official limit, and all through Monday I was often to be seen waiting fifteen minutes or half an hour some three miles from a control, waiting for minimum time to expire before I checked in.

My first warning of coming trouble was encountered on Dashwood Hill, which I only just managed to climb on full throttle at twenty-five miles per hour. This was a slap in the face, as the machine normally climbs 1 in 6 at much in excess of this, and no apparent fault was discoverable. Worse was to come, the short but steep ascent through Bourton-on-the-Hill almost proved too much for it, and the fact that a lot of crack riders pedalled there, and several dismounted, was small comfort to my soul. I trickled on non-stop to Shrewsbury, and very much worried as to what had reduced my hefty twin to about three and a quarter cat power.

When we mustered at dinner, several of us were rather disappointed with our machines' climbing during the day, and I went to bed a sick and sorry man.

Why Carburetters Require Protection.

Tuesday.

Sudden and pronounced attacks of general debility are the most awkward complaint from which a motor cycle can ever suffer. The precious hour for adjustments before breakfast next morning was not wasted, for I discovered my trouble, if I could not cure it. The week before the trials I had fitted a new carburetter with slide control. During the rain of the preceding

day the innards of this vaporiser had got filled up with mud and grit. Result, if I touched either the air or the throttle lever, *both* the air slide and the gas slide moved, as they were jammed up with grit; or, alternatively, *neither* of them moved at all if they happened to be tightly wedged. As a consequence I had evidently ridden most of Monday on one-third throttle, and about half the requisite quantity of air. Why not clean it out, you great juggins? ejaculates the impatient reader. Why not, indeed? Because this particular carburetter possessed no securing bracket, and was held *in situ* solely by the inlet and petrol pipes. It had already split both of them, and to remove it meant complete fracture of them both. There was nothing for it but to wire on additional gauze protectors, and to pour paraffin through in the hopes of dislodging the grit. This I did, but the carburetter contained far too much foreign matter to yield to such makeshift methods. I flushed it out with whole quarts of paraffin at different times, but not till Friday did I get it clean. On Tuesday, Wednesday, and Thursday I could only open my throttle by dismounting and forcing it with a screwdriver, and if I thereafter touched either lever both gas and air slides would immediately assume new and undesirable positions. Hence my "general debility." Wenlock Edge was the first serious hill, and when I closed the air a trifle the throttle promptly closed down as well; when I closed off more air to suit, the throttle shut completely. Got down, opened throttle with screwdriver, shut air with my fingers, restarted, and went up on full throttle and no air. Rode like this all day, using one gallon of petrol per forty miles. Changed rubber belt to leather in the heavy rain, as rubber would not grip with so much surface water on the roads. Full marks for Monday and Tuesday. Query—Are the conditions of a trial sufficiently stringent when one can score full marks with a disorganised carburetter?

Wednesday.

Spent a very paraffiny hour before breakfast trying to get grit out of carburetter. Several very cautious efforts to detach carburetter. Relinquished owing to wobbliness of inlet pipe. Nasty, rough, twisty, narrow road to Dinas Mawddwy (pronounced "Mowthy"). Engine stopped whenever I touched carburetter levers. Decided to run on full throttle and no air all the time, this being starting position. Officials kept us standing an hour at the foot of Dinas in rain. Consolation, all our engines got nice and cool. "What's that, Reynolds? No. 13?" And I was off uphill for four miles. The "climb" opened flat, narrow, and slithery. Burbled along on full throttle and no air. At last caught glimpse of tall black hill towering up towards heaven. Several motor cycles stuck at various points. Frankly unsympathetic crowd rejoicing in the failures. Pouring rain. Blustering wind blowing straight down. Got up first piece nicely. Shut throttle a little on easy pitch.

'No. 13,' a Tale of the Six Days' Trials.—

Tried to open it again on steep pitch. Throttle stuck. Joggled it fiercely. Air opened wide, throttle shut for good. Inevitable result, stopped. Grade 1 in 5. Pushed thirty yards. Personal condition resembled Mantalini after projected suicide (by immersion). Got on to easy pitch. Jammed throttle wide open, all air shut off, started, went up. Descent towards Machynlleth disgusting. Clapped on rear brake too hard—bent brake clip—threw brake shoe out of truth—wore out fibre—no brakes except boots—good for staple trade of Northampton, where I live—bad for me. Several narrow squeaks round corners. Machynlleth at last. Policeman with red moustache points turning. Go down it. Keep on going. Go for twelve miles. Ran out of petrol. Still raining hard. See a farmhouse. Welsh maidens affrighted at my disreputable appearance. Don't know Welsh for paraffin. Don't know Welsh for benzoline. Welsh maidens slam door in my face. Go back to the road and excommunicate my carburetter. Boileau appears. Informs me I am on the wrong road. Excommunicate policeman with red moustache. Excommunicate everybody except Boileau, who gives me petrol. Go back without brakes, and on compulsorily full open throttle to Machynlleth. Policeman with red moustache vanished. Wise man. Through Aberystwyth to Devil's Bridge. Lunch. Good.

A Grey Stripe across the Road.

Leaving Devil's Bridge, the hills were again rather trying with the rear brake out of commission; front brakes are practically useless on motor cycles, although the A.C.U. is so ridiculously fond of them. Hereabouts I saw a grey stripe across the road through the teeming rain, and was glad I had paused to investigate, as it turned out to be a young river in flood. Bashall kindly helped me to push up a steep bank in dodging the torrent. Still raining. More steep descents. Sheep gambolled out of a gap in the hedge into my front wheel. Saw stars. Ran out of petrol. Wondered why carburetters are sold with slide control and no gauze protectors. Pushed a mile. Bought petrol. Still raining. Nice easy road into Shrewsbury. Full marks. Query—Are the conditions of a trial sufficiently stringent when you can get full marks without any throttle or air control, and without any brakes?

Thursday.

Dreadful day. Worst day's motor cycling I ever had. Spent shillings in paraffin, with an eye to Festiniog hill-climb. If I stick on another hill shall lose the gold medal. Can't climb hills if I haven't any carburetter control. Still no brakes. Am not insured. Very uncomfortable indeed. Nice road to Bala. Perfectly diabolical road from Bala to Festiniog. Other riders say it is worse than the Grampians. Didn't think it quite so bad myself. But corners awful, gradients fairish, and surface like new

metal. Moto-Rêve purring over it as if it were on Brooklands. Lucky Moto-Rêve. It has brakes, also carburetter control. Festiniog at last. Reynolds says I must go straight up the hill without altering adjustment of my pulley. Put ancient friendship in jeopardy by mocking at Reynolds. How would he like to try a fearful hill with a 3 to 1 gear without any carburetter control? Reynolds says I may change my gear. Good chap, Reynolds. Change it. Furtively squir petrol on carburetter slides when Reynolds isn't looking. Essay hill. Open extra air when I see hill going straight up vertically, and full of deep granite pits. Machine slows. Fearful language from rider behind trying to get past. "Tutter-tutter." Go up very, very slowly. Wonder what the carburetter slides are doing. Surmise one-third throttle opening and no air. Stop. Verify surmise. About correct. Wedge slides open with a screwdriver. Start again. Up, thank goodness. Road drops away towards Bettws. Narrow. Red triangles on every corner. Yawning precipice on right. Feel glad my wife isn't watching. Feel granite splinter come right through sole of left stocking. Aha! Bettws at last. Grey hairs after lurid descent. Have a rest and a smoke, and buy picture postcards. Foolish, because the next control is a shortish one. Better be starting. Start. Break belt. Put on belt No. 2. Belt No. 2 breaks. Put on belt No. 3. Belt No. 3 breaks. Mend belt No. 1. All is peace. High speed without any brakes into Llandudno. Speedometer records distance as twenty-five miles. Official card only allows nineteen and a half. Too bad, just when every mile looked like being so precious. Good lunch.

An early morning scene during the Six Days' Trials. Sixty minutes before the official starting time, competitors were admitted to Mr. H. Luff Smith's garage at Shrewsbury, for the purpose of cleaning, replenishing, and effecting adjustments to the machines. Our photograph shows these operations in full swing.

Pleasant ride home, except through Flint—long street full of foolhardy children. Got to within three miles of Shrewsbury half an hour ahead of time. Poured rivers of paraffin through carburetter; got it fairly clean at last. Monday's grit almost removed. Ride into Shrewsbury with proper gas and air control. Proud and happy. Easy day on Friday. Gold medal almost in sight.

"No. 13," a Tale of the Six Days' Trials.—

Friday.

Having at last cleaned most of Monday's grit out of the carburetter, I was able to devote the hour before breakfast to other matters, and succeeded in making the rear brake work properly again, so that I started out with every prospect of a really enjoyable day. The speedometer early showed the beneficial effects of being able to adjust the mixture. Had I been using a standard high compression engine, I say without fear of contradiction that I should never have got back to Shrewsbury on the Tuesday. But, thanks to a low compression engine which can never knock or overheat under any circumstances, I had been able to run on full throttle and scarcely any extra air for something like six hundred miles without any trouble. Now that control of the carburetter was restored I looked forward to a pleasant concluding two days. I had tied protectors over the carburetter on the Tuesday, so that no more dirt could get in. I had repaired the brake (quite a brief matter), and I was looking forward to a pleasant conclusion. The circumstances were the same as on the Monday. The machine was much too fast for the rules, and I spent a long while waiting for the clock. The first trouble came at the Cat and Fiddle Hill. I had been officially told we were to be timed up here, and, to make amends for failure on the earlier hills, I let the engine have its head, and went up at an indescribable speed, only to find I could not get round the corners. On went the brake, which promptly broke. Result, I had another long, twisty descent to negotiate with my boots acting as skid pans. Outside Buxton a pin in the timing gear sheared, and caused my retirement. It is only fair to the makers to say that, though I have driven their engines thousands of miles, and know of others which have gone much farther, this is the first engine trouble with one of their machines that I have ever encountered or heard of.

As regards the remainder of the trial, I must confine myself to general observations. My own opinion is that the severity of the hills has been exaggerated in the press. Any reader can estimate how comparatively small a rate of revolutions can be obtained from an engine which is being driven on full throttle and no air with a properly adjusted carburetter. Well, under these conditions my engine climbed the whole of Festiniog Hill except the three yards in which it was restarted and the whole of Dinas except thirty yards, where single-handed I was unable to restart. Therefore these hills are not portentously terrible. In other respects the trial was undoubtedly severe. The weather was bad for about half of the total distance, and several really stiff climbs, such as Wenlock Edge (twice), were thrown in as free extras. The disappointing show made by the entry, regarded as a whole, I am inclined to regard as a chain of bad luck. It is unusual for first-class machines to seize up their connecting rods, to strip a timing key, to break a crankshaft bearing, etc., yet all these mishaps chanced to occur in this particular thousand miles. Duplicates of all these unlucky engines are running ten thousand miles without trouble. The machines of 1909 are a good deal better than these trials would make them out to be. That they appear worse than they really are is not due to the severity of the trials, for many a private owner has put a machine to more exacting tests in a summer tour.

Minor troubles were less frequent than I have ever known them to be. Belt and valve troubles seemed almost non-existent. Punctures were practically unknown, thanks largely to the use of really sturdy back wheel covers. I did not hear of a single side-slip.

The Moral of my Tale.

There are two morals I wish to draw. As above described, I rode some 750 miles practically without any carburetter control, and in addition I broke three belts and a brake. Yet had my timing gear been assembled by a first-class workman, instead of by a temporary hand, I should in all probability have scored the full thousand marks offered for reliability. I should estimate I had something like a hundred stoppages with my carburetter, owing to the throttle closing when I adjusted the extra air or *vice versa*. Are the rules sufficiently stringent to be a real test of reliability when a man who has trouble of this sort can gain full reliability marks? I think, first of all, that the margin allowed between the maximum and minimum speeds of sixteen and twenty miles an hour is perhaps too great, and that the Scottish Trials system of only allowing ten minutes earliness or lateness over a forty miles section is more desirable. Also the waiting outside controls might well be stopped. There was a rule framed this year apparently intended to stop this, but the officials told me no notice would be taken provided competitors waited two or three miles outside checks. As a matter of fact, they waited half a mile or less outside many of the controls, and no notice was taken. The result of this practice is that each competitor secures from four to eight intervals per day, each of fifteen to thirty minutes' duration, during which he can make adjustments and repairs. Whether this is desirable or not is an open question. But my experience is that a man may be in trouble throughout the whole course of an A.C.U. trial, and, provided he does not have any really serious breakdown or two minor troubles in any one section, he can nevertheless secure the maximum marks for reliability. It would have been a mockery if I myself, for instance, had secured full reliability marks this year; yet I only missed them, very possibly, by a pure fluke. Similarly in 1906 I scarcely got through a single control without trouble, and yet I won a gold medal. The motor bicycle of to-day is so good that the maximum reliability award can perhaps only be justly claimed by a machine which has no trouble at all, and if such awards are to be confined to machines which go through without trouble the time margins will have to be tightened, and the scorching ahead to wait outside the next control will have to be stopped.

My Advice to Competitors.

My second moral applies to riders entering such trials. It is a mistake to ride in a trial on a machine that has not at any rate a couple of thousand gruelling miles to its credit before the trial. This applies both to machine and rider. If the machine is absolutely a first-rater the rider's chances are enhanced if he knows it well. If the machine is a new type, as mine was, the preliminary running will bring to light any weaknesses that pass unnoticed through the experimental shop, such as the placing of a carburetter in an exposed position or the use of an unsuitable brake clip.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Sunday Competitions.

[4147].—Anent your paragraph, page 452, regarding Sunday competitions—would the A.C.U. and other bodies kindly inform certain clubmen when they may hold their competitions?

For a man who toils six days for his bread and cheese and wherewithal to spend on motor cycling what other day is open? With the leisured classes it is an entirely different matter, but how many of these fortunate individuals are there to be found in the affiliated clubs?

What is the primary objection—observance of the Sabbath or public disfavour? If the former, is there more harm in going for a run with simply a lunch at the end in one instance, and a medal or cup in another? If the latter, although certain clubs do hold their competitions, what is there to tell the public one is taking place, apart from the gathering (there in either case) outside headquarters and at the destination? As a rule in these friendly competitions the competitors carry no armlets, neither are their machines labelled, and there is no indication but what they are ordinary club runs.

If the A.C.U. means to ban Sunday competitions let it speak right out and forbid them. Affiliated clubs would then know just where they were.

ANTI-HUMBUG.

The M.C.C. London-Edinburgh Run.

[4148].—Referring to Mr. Howarth's recent letters in *The Motor Cycle*, the Committee of the Motor Cycling Club feel that these should be answered to clear away from the minds of the competitors and members any impression that the Club's hon. sec. and Trials hon. sec. are at variance on the matter of checks on the London-Edinburgh run of this year. The whole controversy centres on Mr. Howarth's interpretation of the word "secret" used by both Mr. Candler and Mr. Bell; these two gentlemen both intended to convey the same meaning, viz., certain checks were placed on the route between controls, they were visible to all the riders, there was no hiding behind hedges, "savouring," as Mr. Howarth is pleased to say, of "police traps." In only one sense could they be considered secret checks, in that they were unexpected by the competitors in their particular positions, and were not specially noted on the route cards, although all riders were advised in the rules that they would be timed along the route so as to enforce the fifteen minutes' rule.

Mr. Howarth says that "if the London-Edinburgh run is carried out as it is now it will not benefit the trade." The London-Edinburgh run was not instituted to benefit the trade. I would point out to Mr. Howarth that the Motor Cycling Club is primarily a social club, with social functions and competitions, and although we are sincerely glad to number among our members many gentlemen who are connected with the motor trade (and some of these are the Club's best friends) they join us in the real true sporting spirit.

I have answered this letter somewhat fully because letters such as Mr. Howarth's might do a good deal of harm to a club, the officials of which I am sure receive, from the large majority of its members, credit for doing their best

in the interests of the Club. As to Mr. Howarth himself, he is not a member of the Motor Cycling Club. I therefore fail to discover his *locus standi* in the matter, or his right to interfere in the management of our Club's affairs.

ROBT. H. HEAD,

Chairman of Committee, Motor Cycling Club.

The Six Days' Trials.

[4149].—Although not yet a motor cyclist, I was greatly interested in the trials, and on Thursday, July 8th, my son and I went to Queensferry to see the competitors pass on their way from Llandudno to Chester. After seeing the first three ride quickly past, it was suggested by a gentleman from Mold that we should have a much better chance of recognising the riders if we went down the road about half a mile, as at that point they would have to slow down in consequence of having to negotiate a most awkward corner. We went, and immediately realised that it was not only an awkward, but a positively dangerous one. The first two or three riders who passed us there had difficulty in getting round without running into the hedges and ditches. I think it was the fourth who utterly failed to do so. He ran right across the road into the bank, turned his machine sharply, ran across a cart road leading to a field, then into the opposite bank, again across the main road straight into the ditch on the near side, where, of course, he stopped, with his cycle on top of him! My companions (there were several of us there) rushed to his assistance and extricated him, whilst I went up the road to caution the oncoming riders. Even with our combined efforts of cautioning and directing them there were some very narrow escapes, especially when lots of three, four, and five came together at the rate of fifteen to twenty miles an hour.

Now it struck me very forcibly that far greater caution should be exercised by the promoters for the safety of the competitors. I suppose the pink direction poster signified "Caution," but that is insufficient when fixed amongst other bills on a hoarding, especially so when, as in this instance, it was so badly pasted on that one-half had fallen from the wall and was covering up the other half. We pasted it up again with tyre solution, as it did not seem to have had even a lick of paste.

I would suggest that, instead of "Auto Cycle Union" in small letters, indistinguishable at fifty yards, the simple initials "A.C.U." in block letters double the size should be adopted. For colours there should be used—Green for "go ahead," pink for "caution," and a bright but most unmistakable red (or purple) for "danger." Again, I should like to see the direction arrow of a more distinctive type, clearly drawn, and printed instead of the clumsy one used.

I am sorry to trouble you with so long a letter. My excuse is—(1) The safety of the competitors should, I think, be of supreme importance in these trials; (2) if accidents occur the authorities may step in and effectually stop the sport; and (3) care should be taken not to bring motor cycling into disrepute with the public.

Another point I would like to mention is that the Flintshire County Council should be urged to alter the road at that particular spot by rounding off the sharp corner. Thousands of motor cycles and cars pass it on their way to and from Chester and North Wales.

VIGILANT.

Two-stroke Engines.

[4150.]-In reply to your correspondent, "A. O. C.," who would like readers' experiences with the Scott two-stroke motor cycle, may I be allowed to say a word in favour of it. Although not an owner of one, I am thoroughly conversant with it, especially the marine type engine.

To start with, let us take, for example, our friend Mr. H. E. Rendall's grievances. First, What happens to the engine if a crankcase explosion takes place? Had he examined the Scott two-stroke engine more minutely he would have found it almost impossible for it to occur owing to the design of the non-return valves—an excellent feature in favour of this engine owing to its accessibility and design.

Let us now take Mr. Rendall's second question. I would next advise your correspondent to inspect the Scott carburetter, which is a revelation in design and economy, and the most vital part of a two-stroke motor, and while doing so, should he have the time to examine this engine at high speeds of about 2 to 3,000 revolutions per minute, and at low speeds of about 2 to 300 revolutions per minute, I am sure he will dispense with his fears and rest with a contented mind.

With regard to Mr. Rendall's third question, Why is the displacer pump motor unsuitable for motor cycles? I shall leave Mr. Scott to answer this, as it was he who explained why. But I will certainly say, once Mr. Rendall has properly investigated the Scott type motor I think he will admit it is superior to the displacer pump type despite the alleged extra efficiency of the latter. I, for my part, think it questionable if there is any greater efficiency besides the wear and tear of the extra working parts.

Let us next answer J. H. Hopkins and others, who seem rather prejudiced against the crankcase compression type. They allege lubricant mixing with the fuel, and consequent leakage of compression at the bearings. As Mr. Scott has already explained, owing to the patent spring packing the leakage at the bearings has been overcome. It struck me rather forcibly to see how completely the trouble had been overcome. Lubricating oil mixing with the fuel is rather serious when the crankcase is half filled, but in the Scott engine there are crankcase overflows and properly sighted lubricators.

I must say it is the most perfect two-stroke engine I have come in contact with, and for neatness, flexibility, and reliability, also workmanship, it stands unrivalled as a two-stroke motor.

Wishing the Scott Engineering Co., Ltd., every success,
P. MORRISON MACINTYRE.

Where Improvement is Needed.

[4151.]-Mr. W. G. McMinnies in his article under the above heading asks the following question: "How is it that motor cars can run 10,000 miles without having their pistons and cylinders taken off and scraped?"

From my experience and observation the answer to this question and its remedy is comparatively simple. I don't believe the fault is due so much to the lubrication as to the carburetter, as my cylinder when taken off clearly shows the kind of surface I have been travelling over. For instance, after the Whitsun holidays I took the engine down and the deposit showed clearly a reddish hue. I had been doing North Devon. The time before I had been riding only in the neighbourhood of my home here in South Devon, and the deposit then was a greyish white, corresponding roughly, allowing for burning, with the colour of the roads travelled over.

I said just now the fault was in the carburetter—I meant rather its position. I ride a 1908 Triumph, and I ask any rider to examine his machine after a dusty ride, and he will find the parts around the carburetter coated thickly with dust. It is churned up by the front wheel, carried along by the back draught and sucked wholesale into the cylinder, where mixing with the liquid parts of the petrol that have not been turned into gas forms a hard crust and entails the necessary cleaning.

Now take the position of the carburetter on a car. It is, to start with, under the bonnet, and well to the front, and obtains its air from the very front of the car through the radiators, and therefore exactly opposite to the motor cycle gets nothing but pure air.

I think this to a very large extent answers Mr. McMinnies's question.

It is clearly impossible to alter the position of the carburetter and place it, say, on the handle-bars—by the way, let any rider examine his dusty machine and he will find the middle of the two handle-bars is the cleanest place, if not perfectly clean; but as I was saying the carburetter cannot be placed there, but is it impossible for it to draw its supply of air from there?

My idea is this, entirely enclose the carburetter in a sort of funnel, carry the funnel up through the tank in a slanting forward position with its intake just in the position I have indicated as the cleanest, and therefore least dusty on the cycle. I see nothing insuperable against the idea. The carburetter could easily be adjusted to meet its new conditions, and although I know faulty lubrication has something to do with the fouling of the interior of the

The only passenger machine to finish in the Six Days' Trials was the 3½ h.p. Zenith-Gradua and Sidecar driven by J. Miller. The machine was badly damaged in an accident referred to in last week's issue, but the driver pluckily patched things up, and finished late in the day at Uxbridge.

cylinder, yet I venture to say that the motor cycle would then be equal in point of long running without cleaning to its bigger brother the car engine.

I omitted to suggest that the air intake pipe near the handle-bars could be shaped the same as the ventilating cowl on a steamship, and by that means made to take more or less air as required according to the position in which the cowl is placed.

JAS. EDGCOMBE.

EXPERIENCES WANTED.

"W. H. G." would like users' opinions of the Douglas lightweight, particularly as to its hill-climbing capabilities.

"Ruy Blas" would like readers' experiences with a Moto-sacoche magneto set fitted to an Imperial Rover pedal bicycle. Will the belt miss a 1½ in. tyre, and is the frame strong enough if fitted with a spring fork?

SUMMARY OF OTHER CORRESPONDENCE.

G. Lee Potter writes expressing great satisfaction with the Service Co., London, from whom he bought a two-speed motor bicycle to be used on his daily round of visits as a doctor. He adds: "I have been most pleasantly introduced to the pastime, and this letter is not in any way meant as a puff, as I have no interest in the firm whatever. However, they ought to succeed."

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

Touring Talks.

Nothing will test the comfort-giving qualities of a Saddle more surely than your experience on tour.

Nothing will make or mar your enjoyment more certainly than the presence or absence of those qualities.

In the

BROOKS ANTI-VIBRATORY SADDLE

thousands of Tourists have found an ease and absence of vibration which have made pleasure possible, even under the most adverse conditions.

You can find them too—the first step is to write us for Saddle Manual, which describes each and every model of our range of Motor Cycle Saddles and Seats.

Therein you will obtain full particulars of the many exclusive features embodied in these models, including our Patent Compound Springs, which absorb all vibration within themselves, give a perfect resiliency, and yet eradicate entirely that common fault—a tendency to bounce.

Write now—Dept. B45.

Telegrams: "Primus, B'ham"

In answering these advertisements it is desirable to mention "The Motor Cycle."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be
addressed to numbers at "The Motor Cycle" Office.
When this is desired, 2d. will be charged for registration
and three stamped and addressed envelopes must be sent
for forwarding replies. Only the number will appear in
the advertisement. Replies should be addressed, "Ne-
ooo, c/o 'The Motor Cycle,' Coventry"; or if "London"
is added to the address, then to the number given, c/o
'The Motor Cycle,' 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown person
may deal in perfect safety by availing themselves of our
Deposit System. If the money be deposited with "The
Motor Cycle," other parties are advised of this receipt, and
upon intimation of the arrival and acceptance of the
goods, the money is forwarded less a charge of 1s. for
registration. The time allowed for a decision after receipt
of the goods is three days. For all transactions exceeding
£10 in value, a deposit fee of 2s. 6d. is charged. A
deposit matters are dealt with at Coventry, and cheques
and money orders should be made payable to Iliffe and
Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no
answer to their enquiries are requested to regard this
silence as an indication that the goods advertised have
already been disposed of. Advertisers often receive so
many enquiries that it is quite impossible to reply to each
one by post.

IMPORTANT NOTICE.

Owing to the August Bank Holiday,
the issue of "The Motor Cycle" for
August 4th will be closed for press
earlier than usual. All copy and in-
structions for paragraph advertise-
ments in this issue must therefore
be in our hands at Coventry not
later than the first post on Wednesday,
July 28th.

BERTY Coupler, perfect condition, complete; 17s. 6d., or offers.—A. J. Springett, "Haslemere," Ricay, Essex.

AN IMPROVED SPARKING PLUG.

"I suppose that in my time I have used as many different kinds of sparking plugs as most motor cyclists, and, as in everything else, some of them have proved satisfactory and others the reverse. Lately I was casting about for a plug, the construction of which would be likely to render it free from such defects as I had found in most of the others, and eventually I lighted upon one which seemed, from the look of it, to possess all the essentials necessary to that end. This was the new three-pointed plug recently introduced by Messrs. Lodge Bros. and Co., of 14, New Street, Birmingham. I was attracted in the first instance by a drawing showing the plug in section, which appeared in one of the motor journals, and I at once saw that the design was based on scientifically correct principles, while later, when I had an opportunity of examining one of the actual plugs, my first impressions in its favour were fully confirmed.

"It so happened that I had to make a week-end run of some 350 miles on a twin-cylinder machine, the engine of which, not having been dismantled for a considerable time, was in a somewhat dirty condition internally, while the piston rings in the front cylinder were anything but a good fit, the oil working past them, and getting on to the sparking plug points rather freely. I took the 'Lodge' plug with me as 'spare,' but the first time I was held up, owing to

THE THREE-POINTED SPARKING PLUG.
BY MESSRS. LODGE BROS. & CO.

oil and carbonised matter getting on to the front plug, I banged the 'Lodge' in, and there it is still, no misfiring having occurred subsequent to its insertion. As this happened before ten miles of the journey had been covered, it is certain that I owe my immunity from ignition trouble in the front cylinder to the presence of the new sparking plug. As a matter of fact, I removed the plug at the end of the outward journey, and found the electrodes smothered in oil; but as I had suffered no inconvenience whatever, and, moreover, with a view to giving the plug a thorough testing, I replaced it as I found it, and it fired away merrily all the way home.

"The illustration appearing on this page, for the original of which I have to thank Messrs. Lodge Bros. and Co., gives a good idea of the design of the plug. The sparking points and central pole are substantial in size, and made of pure nickel, guaranteed ninety-nine per cent., thus ensuring against the wearing away of the points by the action of the spark. The spark is brought well into the gap to be ignited and away from the cooling surface of the body of the plug and cylinder walls, so that extremely weak mixtures can be fired. This claim I found to be amply substantiated during my run referred to above. Special care has been taken to secure the best porcelain obtainable and to ensure its being held firmly in place, with due allowance for expansion and contraction. A porcelain sleeve projects round the central electrode, preventing any leakage of the spark over the surface. Spring washers are fitted to hold the high tension cable firm. Each plug is supplied with a steel gauge with which the sparking points can be quickly and accurately set should the gaps have been altered from any cause.

"Messrs. Lodge Bros. and Co. claim that this new plug of theirs is the best yet designed for petrol engines, and I may say that I am disposed to agree with them."

—Reprinted from "Motor Cycle Notes" in the *Model Engineer and Electrician* of July 8th, 1909.

ENGINES.

12h.p. Double-cyl. Horizontal Petrol Engine; £18. Daimler.—F. W. Blenkin, Burstwick, Hull.

REPAIRERS.

REPAIRS of every description promptly executed at reasonable prices; quotations given; workman guaranteed; adjustable pulleys, no tools required, 6d.—Broughton, Waterloo Rd., Hunslet, Leeds.

TO West of England Motorists.—Car and motor repairs, prompt and reliable; cylinders re-bored and new pistons and rings fitted; don't hesitate; straight to us.—Hamlin, Motor Wks., Bridgwater.

CCCCCCCC.—Compression means power; cylinders bored and new piston fitted; guaranteed 4-1,000 in. bears 13 stone on pedal; write for 1 Gradior Machine Co., Compression Specialists, Staff.

BIRMINGHAM.—Overhauling, cylinders re-bored, bushing, pulleys, valves, any make; accumulated and repaired; frames cut down; workman guaranteed; prompt attention.—Priest and Co., Bl Street.

EXCHANGE.

EXCHANGE Tricar for good cob and cash.—See cars.

23 h.p. Bradbury for 3½ h.p. engine, little cash. 24 Gibbins Rd., Selly Oak.

5½ h.p. Twin Rex, spring forks, fast, powerful, new; exchange good 3½ h.p.—7, Carr St., Fulw Preston.

4 CYL. F.N., splendid condition, for 3½ h.p. single good make, or sell £20.—Jackson, Crescent Harrogate.

EXCHANGE 5 h.p. Vindec racer for 1908 Triumph in good order, a real flier.—Cross, Triumph at Rotherham.

6 h.p. Twin Chater-Lea-Coronet, M.O.V., nearly new good single and cash.—Yeats, 18, Sciennes Edinburgh.

EXCHANGE 5 h.p. Twin Kerry, nearly new condition for single 3½ h.p., cash adjustment, or sell.—She Wokingham.

LARGE Graphophone, records, horns, stand, cost £15, exchange good motor cycle.—14, Zermatt Chapeltown, Leeds.

POWERFUL Oak Cabinet Gramophone, latest; cost £15, exchange motor cycle.—1a, Lyall M Eaton Sq., London.

EXCHANGE 3½ h.p. Minerva, H.B. control, etc., cash and low push cycle.—F. N. Mattingley, Burghley Rd., Hornsey.

TWO-SPEED Hub Gear, perfect, fan, and accessories for good push bike, or cash.—39, Summerl Mansions, Muswell Hill.

QUOTATIONS Given of the keenest for exchange with 1909 Rex models. Try us.—Halifax M Exchange, Westgate, Halifax.

EXCHANGE, 3½ h.p. Humber Tricar, splendid condition, for good motor cycle.—Coleman, 48, Bl stock Rd., Finsbury Park, N.

EXCHANGE, 2½ h.p. Clyde engine, new, and 4 Minerva, M.O. valves, for 5 h.p. twin Peugeot Sarolea.—450, High Rd., Streatham.

EXCHANGE, or sell 14 guineas, 3 h.p. motor cycle chain drive, for 3½ h.p. 1907 Rex, other good m —H. Fowler, 41, Beverley Rd., Bolton.

EXCHANGE, £25 Beck Microscope, No. 1 and eye pieces, 1, 4, 1-6 inch objectives, as new, magneto cycle.—Vine-Stevens, Kinver, Staffs.

EXCHANGE 2½ h.p. Werner M.C., and Provident B for £250, paid up £32 for higher power sidecar.—Glazier, 52, Manchester Rd., Swindon.

FOR Exchanges, cash deals, or the like, it will be your own advantage financially to call on Mau 136, Great Portland St., W. Satisfaction guaranteed.

GIVE New Rubber Belt for Xpall spring forks, other accessory. Give brand new gent's cycle, roller brakes, for sidecar.—Booth's Motories, Halifa

EXCHANGE coach-built tricar, 10-12 h.p., three spe and reverse, perfect condition, for Triumph mo 3½ h.p., and cash.—Colelough, draper, Fenton, Stoke Trent.

EXCHANGE, 3½ h.p. Motor Bicycle, inclined eng in good condition. Fitall two-speed gear, and s ear, or sell £11, or offer.—L. Smith, Plumber, H Wycombe.

MOTORS.—Rex, Eadie, and Minerva lightweight, £5, and £5 respectively, or exchange diam jewellery, offers.—Schofield, 2, Wellesley St., Shel Stoke-on-Trent.

WILL give £15 and 2½ h.p. F.N. motor cycle, chased September, 1907, for modern twin m cycle, magneto, suitable for sidecar work.—Mil Salter Gate, Chesterfield.

DENSMORE Typewriter, value £8 10s., perfect; change for cycles, furniture, or anything us to cycle agent.—Apply, X.L., Box L5,785, The M Cycle Offices, 20, Tudor St., E.C.

3½ h.p. Kerry Tricar, free engine, £18 10s., per 3½ 2 h.p. Werner bike, low, light, £5 10s.; motor punt, £28—wanted cash, S.C. lathe, useful changes.—Francis, 6, Dalston Lane, N.E.

3.6 h.p. Magneto Rex, unused, 1909 machine, f with special reinforced Clincher tyres for tou would exchange for lower priced machine and cash sell £20.—32, Rosebery Av., London, E.C.

4 h.p. Roc, magneto two-speed gear, 1908 mac practically unused, and in magnificent order condition: £35, or exchange for lower power and appointment.—101, South Norwood Hill, S.E.

A.C.U. Six Days' Trials.

LIST OF JUDGES' AWARDS.

THE judges have decided that the awards in the above trials should be presented as follows:
"THE MOTOR CYCLE" GOLD MEDALS.—For the best performance by a private owner in the bicycle class: F. S. Barnwell (3½ h.p. Triumph). For the best performance by any competitor on a motor bicycle with variable gear: W. Milnes (3½ h.p. Phelon and Moore, P. and M. two-speed gear).

MISS M. HIND'S CUP (for best performance of a twin-cylinder machine).—T. H. Tessier (7 h.p. Bat-J.A.P.)

A. J. WILSON'S CUP (for best performance of a light-weight machine).—W. W. Douglas (2¾ h.p. Douglas twin).

M. J. SCHULTE'S CUP (for best performance on a single-cylinder machine).—F. C. Mustard (3½ h.p. Triumph).

A.C.U. TEAM PRIZE (for best performance of a team of three machines entered by a trade representative).—Phelon and Moore, Cleckheaton.

WINNERS OF A.C.U. GOLD MEDALS.

A. D. Draper (3½ h.p. Matchless).
 C. Williams (3½ h.p. Triumph).
 W. W. Douglas (2¾ h.p. Douglas).
 P. Phillips (2¾ h.p. Douglas).
 W. O. Bentley (3½ h.p. Rex).
 W. H. Wells (5 h.p. Indian).
 W. Pratt (3½ h.p. P. and M., two-speed).
 W. Milnes (3½ h.p. P. and M., two-speed).
 T. Canby (3½ h.p. P. and M., two-speed).
 J. Slaughter (3½ h.p. Triumph).
 W. H. Bashall (6-7 h.p. Bat-J.A.P.)
 H. H. Bowen (6-7 h.p. Bat-J.A.P.)
 T. H. Tessier (7 h.p. Bat-J.A.P.)
 W. Smith (2 h.p. Moto-Rêve).

G. L. Fletcher (2 h.p. Moto-Rêve).
 O. C. Godfrey (3½ h.p. Rex).
 F. Southam (3½ h.p. Triumph).
 R. W. Duke (3½ h.p. Triumph).
 F. C. Mustard (3½ h.p. Triumph).
 J. Holroyd (1¼ h.p. Motosacoche).
 J. F. Crundall (3½ h.p. Humber).
 A. V. Sumner (3½ h.p. Humber, two-speed).
 F. C. Wood (4 h.p. N.S.U., two-speed).
 W. F. Newsome (3½ h.p. Triumph).
 J. Marshall (3½ h.p. Triumph).
 Gordon Gibson (3½ h.p. Triumph).
 G. E. Stanley (3½ h.p. Premier).
 F. W. Barnes (3½ h.p. Zenith-Gradua).
 G. E. Carrow (3½ h.p. T.T. Triumph).
 F. S. Barawell (3½ h.p. Triumph, two-speed).
 Rev. Basil Aston (3½ h.p. Triumph).

A.C.U. SILVER MEDALS.

G. H. Lake (3½ h.p. Triumph).
 R. Moore (3½ h.p. P. and M., two-speed).
 A. J. Sproston (5 h.p. Rex).
 J. O. M. Dixon (5 h.p. Vindec).
 F. Edmond (3½ h.p. Humber, two-speed).
 O. Parker (3½ h.p. Humber).
 P. J. Evans (3½ h.p. Humber).
 A. Weatherill (3½ h.p. Zenette-Gradua).
 J. W. Morris (3½ h.p. Bradbury).
 P. Platt (3½ h.p. Bradbury).
 J. Eastwood (3½ h.p. Bradbury).
 R. King (3½ h.p. Triumph).
 T. Woodman (7 h.p. V.S.).
 H. B. Lewis (3½ h.p. Triumph).
 R. Fletcher (3½ h.p. Premier).
 A. J. Stevens (3½ h.p. Wolf).

A.C.U. CERTIFICATES.

F. G. Boddington (3½ h.p. Rex).
 G. Simpson (3½ h.p. Bradbury).

BAD LUBRICANTS.

By "IXION."

IHAD thought that the days of inferior lubricants were almost over until I struck the brand recently described in "Occasional Comments," and I received by post the other day from a most reliable correspondent an account of his experiences on a southern tour with a motor bicycle—experiences which tell a lurid tale of villainy. He started with a tank half full of Price's A, and when it was exhausted he chanced to buy the brand of oil I recently condemned as separating into sludge and water at a low temperature. Soon after this oil was put in his engine pulled badly and ran hot, and the plugs carbonised. He went from shop to shop for Price's "A," but could not get it until he met a conscientious cycle agent, who thought he knew where some was to be had. A barrel marked "Price" was found at an oilshop finally, but was very thin—probably "C" water-cooled or gas engine oil. Failing a known brand

of thick oil, my friend preferred thin Price to a dubious thicker oil. The engine ran better on this, but still worked rather hot. At the next town he found a row of samples of Price's oil in a garage—A to C, almost to Z. The proprietor, however, could only supply it in unsealed cans "drawn from the wood," as he averred. So my friend progressed from town to town, paying an average price of eighteenpence a quart, plus 6d. for the tin, always for unsuitable oil, the genuine "A" in sealed cans being unobtainable anywhere. Finally things got so bad that he put up for the night and took his engine down, to find that the pistons were all carbonised, and the rings were jammed so tight in their grooves that nothing would loosen them. The moral is that the big lubricant distributors must keep a far more watchful eye on their agents, and that riders must be careful what brands of oil they buy.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

The Motor Pacing Disaster in Berlin.

BY AN EYE WITNESS.

THE catastrophe at the newly built wooden track at Berlin which occurred one day last week must be ascribed to the popular craving for sensationally high speed. German track managers and owners know perfectly well that a programme without a motor cycle paced race has little or no attractions for the average cycle track frequenter, and in consequence a race of this kind always figures in the programme. It is the ambition of every German manager to be connected with a cycle race track admitting of speeds equal at least to that of an express train, and thrice happy he who owns the track in which the record is broken. New tracks are constructed to meet public requirements, and the one that furnished the scene for the gruesome disaster in Berlin, involving half a dozen deaths, to say nothing of injuries, formed no exception to the rule. Very high speeds indeed are attained on this track, and at the moment the smash took place the motor cycle pacers were "trailing" their respective men at nearly fifty miles an hour. As usual, the immediate cause of the calamity was a tyre failure, an indirect cause being on this occasion the comparatively high position of the pacing machine on the banking at the moment the tyre burst. Krueger, who occupied inside position, had just taken his man past the Swiss follower, Ryser, who was paced by a heavy tandem steered by Borchardt, at the time he appeared to be travelling outside the mark allotted to the inside man; in fact, he admits laxity in this respect, but explains that even on the ordinary curve or banking his tyre failed to bite

properly. Borchardt had no option but to take his heavy machine far up the banking in order to avoid a collision with Krueger and his follower, who fell. As long as the tandem travelled along the line of the central curvature, which is not very pronounced, it ricocheted against the barrier, but on reaching the sharper curve at the entrance into the straight it ran into the barrier almost at right angles. At this point the banking is very steep, forming an obtuse angle with the barrier, so that the latter constituted a sort of inclined plane for the tandem to run up. Had the pacing machine been a single-seated one, the necessary momentum for the fatal climb would doubtless not have been there, but in the case of the tandem, with its own weight and the double load, combined with the speed, the huge tandem and its burden, to the horror of the spectators, went over the barrier, the rear part reaching the floor first. The illustration on the next page shows the front wheel caught on the top of the barrier. The tandem was barely over, when the petrol spirit ignited, and the tank, holding three gallons of spirit, exploded. In an instant the "Kurvenplatz" was a river of fire. By the time the firemen had got the better of the flames several spectators had been burnt to death and a large number severely injured. Ryser, the follower, was thrown over the barrier a little in the rear of the tandem, and he and both his pacemakers escaped with a few bruises and burns. Borchardt did not lose his head during that awful moment, but tried his utmost to counteract the outward swing of the tandem and bring it into

The Motor Pacing Disaster at Berlin.—

the straight. Whether the Berlin catastrophe will induce the authorities to prohibit motor cycles for pacing purposes remains to be seen, but, as might be expected, a number of self-appointed correspondents have rushed into print demanding their prohibition.

The point that is most strange after all is, why did the petrol ignite? Either the exhaust pipes must have been almost incandescent, or the contact maker must have been minus a cover, and the sparks at the contacts must have ignited the petrol vapour. Motor cyclists who ride machines with H.T. magneto ignition will bear us out when we say that it is possible to fall and for the engine to run while the machine is lying on the

ground without the petrol igniting or doing anything more dangerous than cooling the external parts of the engine. In all probability the liquid petrol falling on the hot engine was immediately vaporised and a spark from some part of the exposed ignition mechanism set fire to the vapour. That the ordinary roadster or racer is likely to catch fire in the same manner is extremely unlikely, and even if it be not, the spectators, at least as far as Brooklands is concerned, are quite safe. At Brooklands they occupy the centre of the track and not the outside edge of the racing track over which a competitor is likely to be propelled if a tyre bursts suddenly. Moral: Use tyres that are strong enough and unlikely to burst!

A remarkable photograph of the disaster at the new wooden track at Berlin. Our German correspondent who was an eye-witness of the accident, describes on this and the previous page what happened. Cycle racing with huge pacing motors is very popular on the Continent. The burning tandem required one man to steer it and another to attend to the controlling levers.

—•••— SPRING HANDLE-BARS.

THE almost universal fitting of spring forks on motor bicycles has rendered the use of other spring devices less essential than formerly; nevertheless we think that in many instances, a spring handle-bar, such as the one made by S. Allen and Co. and called the "Ideal," would improve the comfort of many motor cycles. On a rigid framed tricar all shocks from the front wheels are communicated direct to the driver's arms, and on "pot-hole" or rough roads the shocks are most unpleasant. These shocks are not the result of actual vibration such as that experienced at high speed on a motor bicycle with rigid forks, but are more due to the rise and fall of the wheels when running on an unequal surface. The roads in the neighbourhood of Coventry are notorious for what are called "pot holes." In some districts these are filled up with tar and stones and rammed in, but outside the borough of Coventry we

have never noticed any attempt to fill up these holes properly except in a short stretch between Castle Bromwich and Stonebridge. The fact remains that they are most unpleasant, particularly to drivers of small cars and passenger motor cycles. In daylight riders of motor bicycles can dodge these holes. The tyres fitted to large cars bridge the holes, somewhat on the same lines as the *Mauwetania* bridges three waves of the Atlantic, but 26in. x 2¼in. wheels fit these holes in a surprisingly efficient manner. The Ideal handle-bar, which we have tried on a Rex Triette, absorbs the shocks arising from the holes and mounds in a worn road, and we find the machine very much more comfortable to drive than it was with a rigid bar. We can safely recommend the Ideal spring handle bar to all motor cyclists, and particularly to owners of three-wheelers, as these machines are more subjected to road shocks owing to the three tracks.

THE SCOTTISH FIVE DAYS' RELIABILITY
TRIALS.

Tests of new pattern motor cycles.

Next Week's Issue a Day Late.

In consequence of the August Bank Holidays, the next issue of *The Motor Cycle* will be published on Thursday, August 5th, instead of Wednesday. Reports of holiday doings, including the Brooklands Race Meeting and the M.C.C. London to Land's End and back run for the Jarrott Cup, will be included in this number.

A.C.U. 24 Hours London-Plymouth and Back Run.

As announced in our last issue, the Palmer Cup in the above trial has been awarded to P. Moffatt ($3\frac{1}{2}$ h.p. Triumph), whose aggregate error was 4m. 53s. The performance of H. A. Cooper ($3\frac{1}{2}$ h.p. Rex) so nearly approaches the best (his aggregate error being 5m. 8s.), that the judges recommend that a gold medal be awarded him. The other medal winners were given on page 511 of the issue of the 7th inst.

To What Base Uses, etc.

Mr. Ernest Frasetti, one of the troupe of entertainers which performs under the name of Les Frassetis, informs us that whilst journeying from London to Newport, Mon., on his 7 h.p. two-speed V.S. and sidecar, the back tyre burst near Witney. The damage was repaired with a four-ply canvas patch, but this gave out near Gloucester. Time was flying, and Mr. Frasetti was at his wit's end to know what to do, as he was due at the theatre at Newport at 6 p.m., and it was three o'clock when the tyre deflated near Gloucester, and he had still over sixty miles to travel. Suddenly he thought of a copy of *The Motor Cycle* which he had in his pocket. This he folded up and placed between the tube and outer cover, and by this means was enabled to reach Newport in time without further trouble. Mr. Frasetti has sent us the dilapidated remains of the copy of *The Motor Cycle* for our inspection.

Constitution Hill, Swansea, Climbed.

While at Swansea Mr. Frasetti made the ascent of Constitution Hill, with Miss Daisy Jerome as passenger. He has since been informed locally that this is the first time the hill has ever been climbed by a sidecar and passenger. The Borough Surveyor of Swansea gives the following particulars of the hill: Length 1,310ft.; steepest portion 950ft., with an average gradient of 1 in 5, the last 100ft. being 1 in $3\frac{1}{2}$. The sidecar was stopped on the last pitch and restarted, but as the brakes would not prevent the machine running backwards bricks had to be placed behind the wheels.

Cardiganshire Free of Police Traps.

As a result of a paragraph in *The Autocar* drawing attention to police traps on all roads leading to Aberystwyth, the Town Clerk of Aberystwyth communicated with the Chief Constable of Cardiganshire, and asks us in fairness to Aberystwyth and the Cardiganshire police authorities to state that *The Autocar* has been misinformed, for during the past nine months in the whole of Cardiganshire only six of the most flagrant cases of driving through villages—the speed ranged from twenty-three to thirty-two miles per hour—have been prosecuted, and one for driving to the danger of the public. Motors have not been timed on open roads in Car-

medals, and two single-cylinder bicycles will receive certificates. Eleven of the above successful machines had variable gears, and five were fitted with chain drive, the remainder being belt-driven. Altogether forty-nine are to receive an award out of seventy-four starters.

Police Traps.

At Godalming traps are working both ends, and in the middle of the town.

Mold, first mile out on the Denbigh Road, said to be worked three days per week.

We have received information that a police trap is working between Cromer and Overstrand, Norfolk.

Between Thirsk, Yorkshire, and Yarm, about four miles from Yarm. Another two miles north of Yarm, on the way to Stockton.

The Guildford police have instructions to enforce the ten miles limit, which has just been somewhat extended, and are working traps on the steepest part of Hogs Back, near the hospital.

1,500 Miles in One Week.

Mr. Basil H. Davies holds the longest authenticated record, but the following week's running would take a lot of beating. Mr. Hugh Gibson sends us a summary of his journeys from the evening of July 12th to the evening of the 18th inst. On the Thursday (15th inst.) he did not ride. Monday evening (July 12th), Southport to Wigan; Wigan, Ashton-in-Makerfield and back; Wigan to Garstang (picked up Hart-Davies) and back to Wigan; Wigan - Gloucester. 13th, Gloucester, Exeter (lost way ten miles), Okehampton (lost way and went on *via* Callington, Liskeard, to Bodmin) 15-20 miles further round, Redruth, Penzance, Land's End. 14th, trained to Bristol, rode from Bristol, Gloucester, Hereford, Shrewsbury, Chester, Liverpool, and Southport. 15th, did not ride. 16th, train to Willesden, rode to Taplow, etc. (28 miles), and then competed in M.C.C. twenty-four hours' trial (450 miles), finished 8 p.m. July 17th. 18th, left Taplow 10 a.m. and rode home *via* Oxford, Banbury, Coventry, Northwich, Runcorn, and Prescott, arriving at 8 p.m. Two hours stop at Alsager, Cheshire. Mr. Gibson's only troubles all the week were two punctures. The mileage works out at about 1,500 for the six days, yet we are told his 1909 Triumph pulled as well as ever at the finish.

FUTURE EVENTS.

July 28 (Wed.)—A.C.U. Quarterly Trial. Uxbridge to Banbury and back.

„ 25-Aug. 1—The Tour de France Reliability Trials, organised by the Auto Cycle Club de France.

„ 31 and Aug. 2—M.C.C. London to Land's End and back Run for the Jarrott Cup.

„ 31 and Aug. 2—Race Meeting at Brooklands (five events for motor cycles).

Aug. 2-3—Open 400 Miles Reliability Trial for Muratti Trophy, in connection with the Ulster Centre M.C.U.I.

„ 2—Motor Cycle Races at Cambridge Mammoth Show.

„ 2—Motor Cycle Racing at St. Albans Hospital Sports.

„ 18—British M.C.R.C. Meeting at Brooklands.

„ 21—Coventry and Warwickshire M.C. Open Hill-climb.

Sept. 23—THE TOURIST TROPHY RACE FOR MOTOR CYCLES IN THE ISLE OF MAN.

diganshire, and the Chief Constable says that motorists are treated with great leniency. It is to be hoped that Cardiganshire's nearest neighbours will take a lesson from this statement, for we have still to be convinced that Aberystwyth can be reached from England without undue attention from the police, although Cardiganshire may not be the defaulting county.

Six Days' Trials. The Successful Machines.

From the list of judges' awards in the Six Days Trials, it will be seen that twenty-three single-cylinder machines and eight twin-cylinder machines gained gold medals, twelve single-cylinder machines and four twin-cylinder machines will receive silver

Well-known Photographer a Motor Cyclist.

Professor Carlton Lombert, who writes the photography articles in the *Daily Telegraph* and other papers, owns and makes use of a 5 h.p. twin two speeded Rex and a 20 h.p. Rover car. He resides at Cudham, Kent, in the vicinity of the test hill.

A Sensible Move.

So many complaints having been made as to the ten miles speed limit notice-board at Bromley being obscured we are pleased to hear that the board has now been moved, and placed in a much more prominent position nearer Bromley Hill, and over a furlong from the point where the speed limit commences. The police trap has now been suspended, and it is to be hoped there will be no cause for further "timing."

First Aid Tricar.

We understand that the tricar for first aid purposes at fires, for which the Bromley Urban District Council is inviting tenders, will specify a water-cooled engine, two-speed gear, and chain drive. The machine at Beckenham, the first of its kind in the country, has a twin air-cooled engine and belt-drive, but with the two heavyweight firemen, some slipping of the belt, we are told, takes place on steep hills, and especially in rainy weather. This we can readily understand with such a heavy load.

The Fascination of the Folkestone Road.

Since the Brighton boycott, the Folkestone Road has become the favourite seaside run with motor cyclists. The projected cross-Channel flights are proving a fillip to both Dover and Folkestone, and from the crown of Dover and Folkestone hills the fields and cliffs on the French coast are quite discernible on a clear day. The coast road to Margate is in excellent trim. We recommend Margate and Folkestone as seaside touring centres for Metropolitan readers, the roads for some distance round being excellent and free from traps.

A Growing Bad Habit in Scotland.

A young tube worker named Thos. Dickson, residing at Airdrie, Lanarkshire, was last week fined 25s. in the police court for laying down pieces of a broken glass bottle on the public road. It was stated that this menace to motor cycles and motor cars and other vehicles with rubber tyres on their wheels was becoming too prevalent in the district.

Quaint Roadside Signboard.

Motor cyclists riding on the direct road from Canterbury to Margate cannot fail to notice a large and prominent signboard erected in a field adjoining the road near Sturry. On this is painted in white letters on a black ground the words, "Motor cars are the curse of our roads." Apparently motor cycles do not come under the ban. We must be thankful for small mercies. Will some tame idiot erect a notice board in the future calling attention to the fact that aeroplanes are the curse of our skies?

The Two-stroke Scott.

Readers may have noticed that there has been some delay in getting batches of the new model Scott motor bicycle on the road, caused by the makers' determination to have the machine right in every detail before delivering it to private customers. When in Bradford a week ago Mr. Eric S. Myers invited a member of *The Motor Cycle* staff to try the latest machine out of the works on a local test hill. This machine Mr. Myers described as perfect in every way, and certainly its ease of starting, smoothness of running, and hill-climbing capabilities were all that could be desired. Those readers who have two-stroke Scott motor cycles on order should wait patiently for delivery, for they will certainly receive a machine to be proud of. Mr. Phillips, who was a competitor in the Six Days' Trials on a Scott, completed two days runs without losing any marks, but on the third day he experienced an engine mishap. The makers immediately set

to work to guard against a similar occurrence on engines coming through the shops, and by eliminating any possibility of trouble in this manner the machine has reached its present stage of excellence. The week-end before last the designer, Mr. A. A. Scott, made a clean ascent of Sutton Bank on one of his machines, which is certainly a fine performance.

Round the world by Motor Cycle.

At the beginning of last week an American motor cyclist, Mr. T. E. Riley, arrived at Southend-on-Sea, having completed 4,000 miles of his journey round the world by motor cycle, he told our correspondent. He started from Spokane, on the Pacific Coast of America, and the registered number of the motor cycle is K 2433.

An Important Test Case.

A case of interest to motor cyclists has been decided in the Dunmow County Court before his Honour Judge Tindal Atkinson. The claim arose from the destruction of a motor cycle while being filled with petrol by a local motor agent, it being pleaded that his employee had been careless in allowing the petrol to spill upon the heated silencer. Evidence having been given to show that the silencer in question had a tendency to rapidly soot up, and that the owner was not a skilled driver, His Honour, in delivering judgment in favour of the motor agent, held that the explosion had been caused by the petrol vapour having been ignited by soot still burning in the silencer, that the spilling of petrol was a usual occurrence in the filling of motor cycle tanks, and did not constitute carelessness on the part of the filler, and that, finally, a motor agent, on being requested to fill a tank, was not bound to assure himself that the machine was in a fit condition to be filled. It does not follow that another judge would take the same view of the matter. Frequently we have seen petrol tanks overflowed entirely owing to the carelessness and negligence of garage attendants.

At the Norwich City Football Club sports on the 17th inst. a three miles motor cycle race was included. There were ten entries. The illustration shows the start of the final. Reading from the left—H. Duge (3½ h.p. Rex) who won, M. Parfitt (2½ h.p. Peugeot), A. Lincoln (3½ h.p. Triumph) second, and R. O. Clark (5 h.p. F.N.)

OCCASIONAL COMMENTS.

BY "IXION"

A Defect of Some Engines.

Not a few riders and writers have hinted of late that sundry manufacturers are inclined to overdo the horsepower efficiency business. The worst symptom I have struck in some of this year's ultra-efficient single-cylinders is their inability to climb really steep hills when they are hot. We old stagers can remember how the $2\frac{3}{4}$ h.p. machines of 1903 would baulk on hills after they had been driven a few miles on a generous throttle allowance; then from 1904 to 1908 I possessed machines which did not overheat, and were game to climb hills like Dashwood or Broadway or Newnham, even when they had been forced along for many miles at a good pace in the early morning. But during 1909 I have handled two or three different makes which can only take a mile of 1 in 10 when they start cold. If I take them out on a lonely road and drive a few miles in excess of legal limit, and then put them at a stiffish hill of half a mile in length, they invariably baulk. My explanation is genuine overheating, arising from too high a ratio of engine compression. The moral is that the test of a first-class engine to-day is to see whether it will stand hard driving over a short course liberally sprinkled with stiffish hills. If it won't, the probabilities are that it is not suited to localities where steep hills occur every few miles, *e.g.*, Durham or Devonshire.

Standard Machines.

Any sincere club committee who is trying to eliminate special machines from its competitions will run up against a difficulty when it receives the entry of a "small make." To take an actual example, the Trump-J.A.P. and N.L.G. machines have proved rather successful at Brooklands. I do not wish for a moment to imply that these machines were dishonest, or that any blame attaches to their makers if they were provided with details not ordinarily to be met with on tourist machines made by firms with huge annual outputs. These points do not enter into the question at all. My point is simply this: We will suppose the committee of the Blankshire M.C.C. arranges a class confined to standard touring machines both in practice and theory. Attracted by the performances of the two above-named machines at Brooklands, I buy a sample of each and enter them respectively in the single and twin classes of the Blankshire hill-climb. Who is to say whether either of my machines is a standard tourist machine? Of course, if it had exhaust outlets drilled in the cylinders or dummy silencers it could easily be disqualified. But if it had a very light frame and a racing compression it might yet be a standard example of its make. I think it is advisable that the A.C.U. council should draw up a standard equipment of a touring machine, fixing certain mudguard widths, sizes of tyres, and insist on lamp, horn, toolbag, stand carrier, etc., and debarring such racing fitments as noisy silencers or drilled cylinders, and that these rules should be sternly interpreted by the officials in touring competitions. I saw a machine the other day which had just won a premier award in a tourist competition, and its cylin-

der was bored with holes all round at the foot of the piston stroke. I cannot understand how any judge who was not either a rogue or a lunatic could have permitted such a machine to start in a touring event.

Spare Carburetter Jets.

Until all machines are fitted with multiple jets or variable jets riders who use a modern carburetter with easily detachable jets will find it well worth their while to carry an assortment of jets of different sizes. I am now using a Brown and Barlow carburetter, for which I have four jets of as many different bores. The biggest I slip in when I am taking my machine over an ultra hilly course. It enables the machine to

R. M. Brice and the new model $3\frac{1}{2}$ h.p. Brown he rode in the A.C.U. 1,000 Miles Trials. He retired on the fifth day owing to an accident, but had lost no marks up to that point.

accelerate very quickly, and renders it easy to start on up-grades. The bigger of the two medium jets is that which I employ in all ordinary riding. The lesser of the two middle sizes affords the best running on a really sultry day when a long run is to be made at rather high speeds. And the smallest of the four is the best suited to club competitions in which a powerful twin-cylinder machine has to be kept back to a schedule of eighteen miles an hour or so. It is also serviceable whenever I want to gear the engine very low by means of the adjustable pulley, as it keeps the engine very cool; and I can conceive that I may substitute it for one of the others when I want to travel really slowly on greasy roads or right across London from Barnet to Tooting, as the big engine will not run very slowly on its normal jet. I find one air supply serves all four jets very nicely, though as a matter of fact I have a secondary extra air supply which I can call upon should I ever want to use the biggest jet on a very sultry day. The jets only take three or four minutes to change.

QUESTIONS

AND

REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor St., E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Are Pedals Unnecessary?

I think of buying a new Humber two-speed motor cycle with free engine, but would be grateful if you would kindly let me know which is the more serviceable, pedals or foot-boards?—J.A.

There is not very much advantage in having pedals if a two-speed gear is fitted (except for starting the engine), and we should think that you might well dispense with these unless you propose to tour with a sidecar in exceedingly hilly districts.

Oil Escaping from Magneto.

Can you explain why I have trouble with the Eisemann magneto on my 1907 $3\frac{1}{2}$ h.p. N.S.U.? When the magneto is oiled it usually finds its way on to the armature, causing misfiring. The outlets for oil are open. I have had armature winding revarnished, but it makes no difference. The last time I had to take magneto to pieces I found the oil only on brass end plates and iron pieces of armature. When armature is cleaned it goes all right again. Could you recommend an oil that is a non-conductor?—E.M.

The only remedy is to oil less frequently, and try a thicker quality of oil. Water-cooled oil is the most suitable lubricant. Oil is a non-conductor when absolutely clean, but the slightest trace of dirt in it causes the trouble you complain of.

Reducing Vibration.

I have a two-speed chain-driven machine, and the only complaint I have is that, even with a partly deflated front tyre, the vibration coming up to the hands is very considerable, and very tiring. This, of course, comes from the engine being part of the frame. Can you kindly tell me if I can get the special handles recently referred to in *The Motor Cycle* fitted on my handle-bars, and, if so, where I can obtain them? Or failing this, can you recommend me any firm that supplies any device that will reduce this vibration on the hands?—REV. R.

We fancy you refer to the rubber extended handles called the Hartford Rough Rider Grips. These are not suitable for use with inverted levers. The agents are Brown Bros., Ltd., 15, New-man Street, Oxford Street, London. If these do not reduce vibration sufficiently, try also the spring handle-bars made by S. Allen and Co., Elswick Court, Northumberland St., Newcastle-on-Tyne.

Fitting a Free Engine Clutch.

I want to fit a free engine and adjustable clutch pulley to my $3\frac{1}{2}$ h.p. Premier. I am advised that one cannot be fitted owing to large boss on crankcase, $2\frac{1}{2}$ in. diameter. (1.) Would it be safe to turn $\frac{1}{4}$ in. off the end of boss as suggested? (The boss contains a cup containing ball bearings.) (2.) Is the Albion clutch and free engine thoroughly satisfactory in operation and wear? Can you strongly recommend it? (3.) Does it entail any side or end push, or thrust, or damage engine in any way? (4.) Are there any similar devices on the market except Mabon and Albion? If so, please name them.—T.D.F.

(1.) Probably it would be quite safe to turn $\frac{1}{4}$ in. off the end of the boss, but if your engine is a White and Poppe we should advise you to write to this firm and ask them if turning down the boss in this manner will, in their opinion, do any harm. (2.) We have heard good accounts of the Albion clutch, and have no doubt you will get satisfaction from it. (3.) Your engine being of substantial build would be hardly likely to be damaged by the

use of an engine-shaft clutch. The end thrust when the free engine is in operation is taken up by ball bearings. (4.) We know of no others without variable gear.

Engine Knocking.

Can you account for the knocking in my engine? I have had same taken down and cleaned, also carburetter and valves seen to, but directly the engine begins to take up the load, or when I accelerate on the level, it knocks badly. I have tried every method of driving, have had timing regulated, and thoroughly seen to lubrication, but still it knocks, and my repairer (a practical man) says he cannot understand it. Can you suggest a cause or a remedy?—Y.A.

Possibly you are using a sparking plug the points of which project rather too far into the cylinder, get red hot, and cause pre-ignition. Try changing the sparking plug, and also reducing the air when the knocking begins. Other likely causes of the knocking are too high a gear for your weight, and the timing of the spark too far advanced.

G. E. Stanley ($3\frac{1}{2}$ h.p. Premier) making a fast ascent of Birdlip Hill on the last day of the A.C.U. 1,000 Miles Trials. His performance drew forth hearty applause from the spectators. The photograph does not convey an accurate idea of the gradient which is 1 in 6 at this point. Half a mile lower down, at the Knap, the gradient is 1 in $5\frac{1}{2}$. Stanley was one of the gold medal winners.

Easy Starting and Slow Running.

[?] I am thinking of having dry battery ignition for my 1908 Moto-Rêve cycle, in addition to the magneto ignition. My objects are—(1) easier starting, (2) slower running, and (3) greater reliability. Can this be done? If so, would you be so kind as to give directions as to how it should be done? —Dr. P.

The fitting up of a dry battery ignition to your machine would be somewhat of a difficulty, as it would mean extending the shaft drive on the magneto, fitting up a new contact breaker, and carrying two plugs in each cylinder. It would be far better to turn your attention to the carburetter, and get it adjusted so that you can run slowly and start easily.

Slow Running.

[?] I have a 5 h.p. twin Peugeot engine in Châter Lea frame. It has an Advance adjustable pulley at the lowest possible ratio—about 5 to 1—but I am unable to run the engine steadily at less than 15-17 m.p.h. It will climb any hill and reach very high speeds. Can you tell me how to slow the engine speed? My carburetter is H.B. Amac, and ignition plain coil. The commutator has not a very long range, but I can get from 17 to 55 m.p.h. from it. At the same time the engine knocks as soon as I get down to 17 m.p.h., and only the back cylinder fires below that speed, and neither fires below 15 m.p.h. I do not want to put on a smaller pulley, as the engine has a tendency to overheat. The engine is quite clean, and was overhauled by a good firm a few weeks ago.—L.F.E.

The simplest way is to fit a device to the carburetter called White's economiser. This restricts the amount of air admitted *via* the main air inlet, causing a greater suction on the jet, and thus enabling a richer mixture for easy starting and slow running. If only one cylinder fires at slow speeds, it points to the contact breaker points being adjusted unequally, or the inlet valve springs of different tension, or the amount of the openings not equal.

Using a Voltmeter as a Speed Indicator.

[?] I have a four-cylinder machine which is fitted with a Bosch magneto, to which is attached a handle-bar switch for short-circuiting the current. I have been thinking of investing in a speedometer, but have been wondering whether the speed of the engine and (as the latter is direct geared to the back wheel) of the cycle might not be determined by voltmeter showing the pressure of the dynamo output. I understand that the voltage varies directly as the revolutions, so that the former should give an exact index of the speed of the machine, but am not sure whether a voltmeter might be

NEXT WEEK

THE MOTOR CYCLE

WILL APPEAR ON

THURSDAY

ONE DAY LATER THAN USUAL.

interposed in the short-circuiting leads without impairing the efficiency of the dynamo as a current producer. As the resistance of the voltmeter would be high I am inclined to think that it would not injuriously affect the system. I am ignorant, however, as to the effect of the make and break and consequent discharge upon the voltage, and whether a voltmeter would be at all a suitable indicator when subjected to the vibration of a motor cycle. I know that some speedometers (Vulcan, for example) operate upon this principle, but with direct current, whereas I think I am right when I say that the Bosch and Simms magnetos deliver alternating current. Would you be kind enough to advise me as to the feasibility of the scheme?—M.E.D.

We presume you wish to use the pri-

mary current of the magneto in conjunction with a voltmeter for determining the speed of the engine. This is a matter we have never tried any experiments with, but one thing—on the assurance of the Bosch Magneto Co.—we can say with certainty, and that is that the magneto used on the F.N. motor cycle, which is the machine we believe you have, has been brought down in size so as to just have sufficient power to perform the work imposed upon it, and we are certain that other work cannot be put upon it without detrimental effect to the running of the engine. There is, of course, not only the question as to whether the amount of energy is sufficient. There are many other questions as regards condenser, and so on, that will have to be taken into consideration. In addition to this, only a hot wire instrument could be used for regulating the speed, and this could not be expected to work at low speeds, as there is an interruption of the current every half cycle, and although the current generated by the magneto is actually classed as an alternating current, it is not distributed as an alternating current, as each cycle is cut in half, and the half cycle used to produce the spark, and we would strongly recommend that the magneto should be left alone to perform its own duties.

READERS' REPLIES.**Starting by Pushing.**

I found my $3\frac{1}{2}$ h.p. single-cylinder N.S.U. difficult to start by pushing, the back wheel nearly always skidding, so I took off the cylinder and inserted another sheet of fairly thick brown paper as packing between the crank chamber and cylinder, of course, leaving the original packing there as well. This dodge does not affect the valves in the least. Now I can always start up my motor by pushing it along at three or four miles an hour. I dare say if "F. W." will go to the trouble to remove his cylinder and fit brown paper coated with oil, his difficulty will disappear.—JERWERTH MORRIS.

Some competitors in the School of Mines Students' Association (Adelaide, S.A.) eighth annual sports on May 22nd last. The winner was H. Behrens, who is second from the left with his 3 h.p. N.S.U. His time for the three miles was 4 min. 22½ secs.

Scottish Five Days' Reliability Trial.

EDINBURGH TO JOHN-O'-GROAT'S AND RETURN.

THIS event, organised by the Edinburgh Motor Cycling Club, took place last week, commencing Monday, the 19th inst. Some notes on the start were published in the last issue (page 46).

First Day.—Murrayfield car terminus, via Stirling, Crieff, Sma' Glen, Amulree Hill, Aberfeldy, Pitlochry, Newtonmore, Carrbridge, and Inverness. Approximate distance 186½ miles.

The following is the official list of starters and numbers:

1. W. W. Douglas (2¾ h.p. Douglas).
2. R. H. Salvesen (3½ h.p. 1909 Triumph).
3. A. H. Hay (3½ h.p. 1909 Rex).
4. A. A. Dixon (3½ h.p. 1909 Bradbury).
5. J. D. Morrison (5 h.p. 1909 T.T. Matchless).
6. W. Niven (5-6 h.p. 1909 F.N.).
7. J. M. Dobson (5 h.p. 1908 Vindec).
8. B. P. McRae (3½ h.p. 1908 Triumph).
9. A. G. Bostock (1909 T.T. Triumph).
10. G. L. Fletcher (2¾ h.p. Douglas).
11. C. McGregor (5 h.p. 1909 T.T. Matchless).
12. A. Pearson (3½ h.p. 1908 Triumph).
13. R. S. Morrison (4 h.p. 1906 twin Werner).
14. D. H. Gainsford (3 h.p. Advance, Roc gear).
15. S. J. K. Thomson (3½ h.p. 1907 Triumph).
16. G. Wilson (3½ h.p. 1908 Triumph).
17. A. Downie (3½ h.p. 1909 Ariel).
18. W. Scott (3½ h.p. 1908 Triumph).
19. G. Muirhead (4 h.p. Matchless).
20. M. Pratt (3½ h.p. 1909 Brown).
21. Q. Clark (5 h.p. 1906 Rex).
22. W. Atkinson (3 h.p. Cheviot).
23. C. N. Henderson (1909 T.T. Triumph).
24. W. Brown (3½ h.p. 1909 Bradbury).
25. J. Donaldson (3½ h.p. T.T. Matchless).
26. G. Alexander (3 h.p. Midget Bicar).

There were seven non-starters.

The trial opened in glorious weather, a warm sun pleasantly tempering a strong headwind. No rain fell all day, but the run was sufficiently arduous, as covered 190 miles, including the ascent of Amulree and the crossing of the Grampians. For no one was more arduous than for the writer. To begin with, he was acting as judge; secondly, he was the only photographer accompanying the run; thirdly, the representative of the Scotch papers had a breakdown, and implored *The Motor Cycle* correspondent to send the news to Glasgow as well as Coventry; fourthly, not a single competitor succeeded in climbing Amulree, and from 10 a.m. till 1 p.m. in the intervals between taking notes and photographs I helped to push eighteen different motor bicycles up the hill.

The first thirty-five miles until we were clear of Stirling were far from pleasant. The district was populous, the surface execrable, and much of the road under repair. Having escaped these obstacles, we were able to enjoy the lovely scenery further on, and pushed on rapidly to the famous ascent of Amulree.

Arrived there, we found a very strong wind blowing straight down the hill, far stronger than the gale which raged down Dinas Mawddwy in the A.C.U. trials. The surface was bone dry, but rather rough. The hill measures a mile and a half from start to finish, and some of it is fairly easy, but there are two or three pitches nearly as bad as 1 in 5, and after a mile comes the ill-famed S bend. The two corners are so severe that no one can round them at more than about six miles an hour, although the Scottish A.C. had them windened and banked up this year. Not one competitor climbed the hill. At the same time, the hill struck me as a perfectly fair, though very severe, test. Mr. Adamson, of the Perth club, made three separate clean ascents in my presence on a pedalless touring Triumph with a hot engine. This performance shows that the hill can be climbed every time by a clever rider who knows it. The competitors failed because they were either strangers to the hill or inefficient motor cyclists or green at the competition game. For instance, several riders hugged both the bends closely, and were not prepared to pedal. Had they swung wide where the grade was easiest and kept their feet on the pedals a dozen or more would have gone up easily. Several of the machines were in no sense tuned up, and stuck right at the bottom on a 1 in 10 grade. Again, several riders "scrapped" out from the check at Crieff at a fast pace, and essayed the hill straightaway without giving their engines a chance to cool. Many had fixed pulleys and idiotic gears; one rider of a 3½ h.p. was geared 3½ to 1.

Pratt on his 1909 3½ h.p. Brown made decidedly the best attempt of all. He rode clean round the S bend in splendid style, and had he swung wider at the second corner and pedalled would have climbed the hill fast. Fletcher on the 2¾ h.p. Douglas looked more like getting up than anyone else except Pratt, but pulled up at the second corner.

My impression is that if the A.C.U. entry had attempted the hill quite a third of them would have made clean ascents.

The remainder of the ride necessarily proved something of an anti-climax. The road over the Grampians was in better condition than I have ever seen it, and the terrible descent from Amulree down towards Kenmore had troubled no one except Scott, who tore out his tyre valve, but was able to borrow a butt-ender, and he also broke an engine valve later on. The following retirements are reported: Ray Morrison, last seen in trouble with his twin Werner three miles north of Crieff; Dixon, magneto trouble four miles south of Pitlochry, and trained on to Inverness; Quinton Clark, riding Felix Scriven's 1906 5 h.p. Rex, tore his belt rim completely out of the back wheel

SEE THAT NOSE?

IT'S
HINGED.

Strikingly standing out amongst many other excellent features which characterise the modern "QUALITY" saddle—

LYCETT'S 'La Grande'

L. 30

MOTOR MODEL

you will find on inspection the two particular improvements to which we ask your attention here. Glance at the points and note—

1st. This model constitutes the perfect anti-vibratory system with the combined action of THE HINGED NOSE at front and Spring Power at back. This hinged nose above the coil gives the saddle great sensitivity and smoothness in meeting road shocks and vibration.

2nd. It TENSIONS, or adjusts, at THE BACK. Over the powerful springs you see the projecting nuts of the tension rods. These provide easy adjustment and give added longitudinal strength.

These important features are essentially Lycett's own, and found only on Lycett's L. 30—the leading Motor Saddle.

Be satisfied with nothing less than a Lycett, and get one TO-DAY. Don't procrastinate with pleasure. Saddle-book free.

THOSE
NUTS -

AT THE BACK!

Scottish Five Days' Reliability Trial.—

two miles south of Newtonmore, and trained into Inverness.

The following lost no marks: S. J. K. Thomson (Triumph), J. M. Dobson (5 h.p. Vindec), and R. H. Salvesen (3½ h.p. Triumph).

The remainder lost marks as follows: Muirhead 161, Scott 168, Bostock 17, McGregor 11, J. D. Morrison 14, Fletcher 4, Hay 75, Douglas 29, Henderson 28, Wilson 28, Pratt 30, McRae 83, Niven 80, Atkinson 142, Gainsford 42, Pearson 83, Donaldson 138, Brown 121, and Downie 20.

Second Day.—Inverness, Dingwall, Tain, Bonar Bridge, Evelix, Mound, Brora, Berriedale, Wick, John-o'-Groat's, and Thurso. Approximate distance 177 miles.

At 3 a.m. on Tuesday I was nearly blown out of bed, and, getting up, I found a terrific gale blowing and heavy storms of rain sweeping over the town at brief intervals. This weather continued all day. The roads were indescribably bad for practically the entire distance of 176½ miles between Inverness and Thurso, and the competitors reached their destination draggled and plastered with mud from head to foot. Probably no competitors in any motor cycling trial have ever had to face such an exacting journey, though, fortunately, the wind veered round from the north towards the west, and so its stopping power on the long ascent of the Ord was negligible

ever had punctures, he would escape, for his rear wheel was shod with a Thorne puncture-proof cover (overlapping steel discs embedded in the rubber), and contained a Dreadnought Clincher inner tube about ⅜ in. thick. However, two miles from Wick the joint in his inner tube came unstuck, and as he was riding fast to make up time he was thrown over his handlebars, luckily escaping serious injury. The men who lost no marks, averaging twenty miles an hour all day over the frightful roads, have registered extremely creditable performances. Berriedale Hill proved more of a stumbling block on this occasion than in the End-to-end trial last year, comparatively few of the riders rounding the double corner successfully. They will readily be excused, as the whole hill was greasy, and a very heavy storm (the worst of the day) burst over it after the first half-dozen men had gone up. The men who had R.O.M. combination covers on their back wheels were able absolutely to ignore the grease.

The Steep, Denholme, the scene of the Bradford M.C.C. Open Hill-climb on the 17th inst. The left-hand illustration shows the second bend on the hill, while the right hand illustration is of the 1 in 6 section at the summit.

(Photograph kindly sent by H. W. Turner.)

Amongst the exciting experiences of the day may be mentioned the breaking of a handle-bar by Thomson whilst pedalling hard up the Ord. He pluckily rode on to Thurso with only half his bar, and by an extraordinary piece of luck the Thurso agent had a spare in stock.

We on the official car had no time to stop for lunch at Brora, as we wanted to reach Berriedale ahead of the first man, so I went into an hotel and ordered a packet of sandwiches. "Wull ye hae canny anes or wee anes?" quoth the landlady. I replied that I wanted a generous supply for two persons. When I returned ten minutes later the ample figure of mine hostess was almost concealed behind a huge pile of a dozen sandwiches, each consisting of two enormous slabs of bread about a foot square and an inch thick, and containing about 1 lb. of ham apiece. "It'll be 9s.," quoth the landlady; "twelve canny sandwiches at 9d. apiece." I refused to burden myself with the whole of this enormous bale. "Ye'll tak the hail or ye'll

—in fact, it only met the riders head on between John-o'-Groat's and Thurso. The roads having been dry on the previous day, the grease was often of a dangerous character, and spills were frequent. The corners on the Ord, which are very acute, were so slimy that the riders had to slow right down to get round safely, and as a consequence few of them reached the summit without pushing or heavy pedalling. Portions of the route were scarred with deep pot holes full of surface water, and belt slip with rubber belts was almost universal. To add to the general misery, punctures were very common. At the start Henderson, of Ayr, prophesied that, who-

Scottish Five Days' Reliability Trial.—

tak nane," she retorted curtly. So I "tak nane" from her, but got cheaper and better supplies across the road.

We saw one competitor well ahead of his time and riding hard, so we sang out, "You're ahead of time."

S. J. K. Thomson (3½ h.p. Triumph) rounding the first bad corner near top of Amulree Hill. Note the fishing creel on his carrier.

He replied, "Man, a'ken naething at a' about time, I'm juist riding as fast as a can!" This is a fair sample of the methods of certain inexperienced competitors.

I observed the following riders on Berriedale Brae: Dobson (5 h.p. V.S.) failed on corner; Morrison and McGregor (both on T.T. Matchless machines) came up too fast, jumped off at the corner, ran a few steps, and went up well; Thomson (Triumph) rode clean up the hill, pedalling on the corner (one of the best performances, as he cut across the steep part of the corner); Salvesen (Triumph) came up slowly, and jumped off after rounding the bend; Fletcher on the lightweight Douglas came up too fast, and had to jump off hurriedly on the corner, but went up without pedalling, good; Downie on the Ariel rode up with splendid judgment, slipping his clutch on the bend; Bostock (Triumph) fell off at the corner; Douglas on his lightweight made a very neat and fast ascent with pedal assistance; Pratt (3½ h.p. Brown) very fair; Wilson (Triumph) very fair; Hay (Rex) failed at corner; Gainsford on the two-speeded Advance made an excellent climb, rounding the corner on his low gear.

It is interesting to note that, owing to the number of cars smashed on the southern side of Berriedale Brae, the authorities have put up a board at the summit with the notice, "In case of brake failure, use emergency road," and half-way down the hill a short road forks off to the right, being specially constructed with an up-gradient of 1 in 5 to stop runaway motors.

Donaldson (3½ h.p. Matchless) failed to arrive by nine o'clock.

The following have lost no marks to-day: Salvesen, J. D. Morrison, Dobson, Bostock, Fletcher, Gainsford, Thomson, McGregor, Wilson, Downie, and Pratt.

Others have lost marks as follows: Douglas 53, Hay 36, Niven 38, McRae 122, Pearson 22, Henderson 125, Alexander 35, and Scott 48; Muirhead lost his checking card.

M. Pratt (3½ h.p. Brown) falling off at the second bad bend near top of Amulree Hill, after climbing up farther than any other competitor. There are stretches of 1 in 5 on Amulree.

No matter when you buy the bicycle—

No matter where you buy the bicycle—

No matter what the bicycle—as far as the saddle is concerned be persistent, be emphatic and "SAY BROOKS."

Scottish Five Days' Reliability Trial.—

Third Day.—Thurso, Bettyhill, Lairg, Bonar Bridge, Alness, Dingwall, and Inverness. Approximate distance 141 miles.

The Scotch "trials" must be understood in a scriptural sense. Amulree and the Grampians and the distance combined to make Monday a very trying day. Tuesday, owing to the awful weather, was the

Dingwall was the finest I have ever seen in Great Britain.

Scott withdrew his Triumph at Thurso this morning, his leg being painful from an accident before the trials. News came in that Donaldson had broken his cylinder in a fall near Tain last night, but was riding on, and that Ray Morrison's retirement at Crieff was due to a derangement of the magneto timing gear.

The number of starters this morning was thus reduced to twenty, of whom only thirteen had arrived by 9 p.m. Salvesen, T. D. Morrison, McGregor, Fletcher, Thomson, and Pratt have earned full marks for the day—a remarkably creditable performance, recorded by such pluck and endurance as have rarely before been equalled.

Hay, McRae, Pearson, Muirhead, Atkinson, Henderson, and Alexander are all missing, and were last heard of in trouble with tyres.

The following have lost marks: Douglas 147 (both tyres ruined), Niven 4, Dobson 14 (broken inlet valve), Bostock 164 (nine punctures and three falls), Gainsford 15 (he has one of the smallest engines in the trial, and felt the head gale severely), Wilson 15 (punctures), and Downie 54 (punctures).

The two Brooklands Matchless machines are doing splendidly, as are several of the Triumphs, Pratt's 3½ h.p. Brown, and Fletcher's lightweight Douglas.

10 p.m.

Alexander, Henderson, Atkinson, Pearson, and McRae have just arrived, having been on the road fourteen hours for 140 miles. They have lost all

Competitors arriving at the Garage—Thurso.

hardest day's trial I have ever known. To-day is stated by the men who have at present arrived to have been far worse than either Monday or Tuesday. It was raining when the men left Thurso, and pot-holes and puddles, plus a head-on gale, caused many riders to be late over the first section of thirty-two miles to Bettyhill. From Bettyhill the men had to strike due south over a steep switchback road to Bonar Bridge, and for about thirty miles the road consisted of a constant succession of patches of rough granite blocks. It was like riding mile after mile over newly laid unrolled road metal. Spills were frequent, accessories on the machines came loose by vibration, and some of the thinner tyres were badly cut. I noticed several machines in the Inverness garage to-night minus axle nuts on both front and back spindles. Bostock had his tyres gashed clean through by sharp stones on nine separate occasions. Gainsford and Douglas both broke the tiny pins holding the balance bobs in their carburetter float chambers—an extraordinarily unusual mishap, especially when occurring in duplicate. When Bonar Bridge was once passed the roads were excellent, and the view from the top of Fearn Hill on the short cut across the mountain, to

A competitor half-way up Amulree, which accounted for so many failures. The surface is exceedingly rough.

British Five Days' Reliability Trial.—

marks for the day, and have scarcely had anything to eat. They report a fearful journey as far as Bonar Bridge. They have seen nothing of Hay and the remaining absentees, who have probably retired north of Lairg, where there is no railway. Up to date Salvesen and Thomson, both on 3½ h.p. Triumphs, are the only men who have lost no marks at all. Fletcher is third (four marks lost), McGregor fourth (eleven), Dobson and Morrison equal sixth (fourteen), and Pratt eighth (thirty). All these performances are probably better than any previous achievement in any British motor cycling reliability trial.

Fourth Day.—Inverness, Nairn, Forres, Elgin, Huntly, Aberdeen. Approximate distance 105 miles.

To-day's run was comparatively easy. Fine weather favoured the competitors, and for once the roads were fairly level. Yesterday's missing men arrived at Inverness in the small hours, except Atkinson, who has

A Scottish Trials competitor climbing Berriedale, probably the most severe hill on the route.

retired. Hay on a Rex arrived at 4 a.m. Being unable to wake the porter, he burgled the window, and slept on a chair in the lounge. It appears that in restarting from a side road on a steep hill Hay went over a bank and 200 feet down the side of a ravine. He was hauled up by four men, and finished after twenty hours on the road. Order for special prize, best performance: Salvesen and Thomson, both on Triumphs (lost no marks), and Fletcher on Douglas third (lost four marks). Muirhead has not been heard of since yesterday.

The little 8 h.p. Humber carrying officials has come through the trial non-stop to date.

Douglas, Salvesen, Hay, Morrison, Niven, Dobson, Fletcher, McGregor, Pearson, Thomson, Downie, and Pratt have gained full marks to-day. Bostock lost thirty-five and Gainsford three. McRae, Henderson, Wilson, and Alexander are missing at time of writing.

Machines will be detained to-morrow night for B. H. Davies and Gordon Gibson to examine their condition. The police were out with watches and a telescope near Nairn, but the official car spotted them, and warned the competitors.

Fifth Day.—Aberdeen, Laurencekirk, Brechin, Perth, Stirling, Murrayfield Car Terminus, Approximate distance 149 miles.

The Scottish motor cycle trials were concluded to-day (Friday), July 23rd. The distance ridden was 140 miles *via* Brechin, Perth, and Stirling.

The road is an easy one for motor cycles, but a furious headwind met the competitors, and considerably delayed their progress. They were also hampered by frequent heavy storms of rain, which fell at intervals throughout the day. Of the twenty-six starters (see page 562) sixteen have qualified for awards. The names of the riders who qualified for gold medals and the names of the machines they rode are as follows: No. 2, H. H. Salvesen (3½ h.p. Triumph); No. 15, S. J. K. Thomson (3½ h.p. 1907 Triumph). Both these competitors secured full marks. H. H. Salvesen also won the special prize for the best performance by a rider using British-made pneumatic tyres; he rode Palmer Cords.

H. Davison (3½ h.p. Rex) hon. sec. of the North Islington Conservative and Unionist M.C., who won a gold medal in the M.C.C. 24 Hours' Trial on the 17th inst.

Silver Medals: N. 10, G. L. Fletcher (2¾ h.p. Douglas); No. 11, C. McGregor (5 h.p. 1909 T.T. Matchless); No. 13, R. S. Morrison (4 h.p. 1906 twin Werner); No. 7, J. M. Dobson (5 h.p. 1908 Vindec); No. 20, M. Pratt (3½ h.p. 1908 Brown); No. 16, G. Wilson (3½ h.p. 1908 Triumph); No. 14, D. H. Gainsford (3 h.p. Advance, Roc two-speed gear); No. 17, A. Downie (3½ h.p. 1909 Ariel).

Bronze medals have been awarded as follows: No. 6, W. Niven (5-6 h.p. 1909 four-cylinder F.N.) No. 1, W. W. Douglas (2¾ h.p. Douglas); No. 12, A. Pearson (3½ h.p. 1908 Triumph); No. 3, A. H. Hay (3½ h.p. 1909 Rex); No. 9, A. G. Bostock (1909 T.T. Triumph); No. 23, C. N. Henderson (3½ h.p. 1909 T.T. Triumph); No. 19, G. Muirhead (4 h.p. Matchless-J.A.P.)

All the above are in order of merit in accordance with marks gained and the condition of the machine at the close of the trials.

A. H. Hay wins the prize presented for the best performance on a Rex motor cycle.

Those who finished the trials outside the maximum schedule time were: No. 26, G. Alexander (3 h.p. Midget Bicar); No. 8, B. P. McRae (3½ h.p. 1908 Triumph); No. 25, J. Donaldson (3½ h.p. T.T. Matchless-J.A.P.)

The remaining six competitors retired at various points of the route for reasons I have already stated.

The only machine

in the 6 days' A.C.U. Reliability Trials that can claim the following remarkable record is the

N.S.U.

fitted with N.S.U. Two-speed Gear.

1. The only make represented by one model.
2. Ridden and entered by an owner-amateur.
3. AWARDED GOLD MEDAL.
4. A standard pattern throughout.
5. Awarded full marks.
6. Performances on all hills officially reported "EXCELLENT."
7. Machine and two-speed gear finished in excellent condition.

NOW NOTE THIS:—

This performance will be more appreciated when the fact is pointed out that the 4 h.p. N.S.U. model de luxe was purchased by Mr. F. C. Wood—the rider—only two days before the commencement of the trials, and that it was an ordinary stock model taken from the window.

Messrs. The Bosch
Magneto Co., Ltd.

Dear Sirs, — The following may be of interest to you. On Monday last I paced Mr. J.B. Hart-Davies from Garstang to Land's End on his record ride. On Wednesday I rode home to Southport from Bristol. On Friday and Saturday last I competed in the M.C.C. 24 hours (450 miles) Trial, gaining second place (only three marks behind the winner). On Sunday I rode home from Taplow. The total distance covered by me in the 5 days was 1,500 miles, and during this mileage I have never touched the Bosch plug nor experienced a single misfire. The plug has now done upwards of 2,000 miles of hard work the engine being run for a large number of hours at a stretch, and it is a wonder to me that a plug could stand such a continuous strain. I shall certainly use no other than the Bosch plug as I am convinced it is absolutely trustworthy.

Yours faithfully,
(Signed)
HUGH GIBSON.

Scottish Five Days' Reliability Trial.

The official car—Gordon Gibson's 8 h.p. Humber—came right through the trials and completed the whole course without an involuntary stop; this despite the fact that the selected course was the most arduous I

have ever known. The Scottish Trials course was far more exacting than the one selected for the A.C.U. 1,000 miles trials. It is therefore not surprising that the performances on some of the precipitous hills were somewhat disappointing. **BASIL H. DAVIES.**

MILITARY MOTOR CYCLING.

THE M.U. MILITARY MOTOR CYCLISTS' SCHEME.

The Motor Cycle Committee of the Motor Union has been in communication with the War Office on the subject of military motor cycling. The chairman of the committee has had an interview with the authorities, with the result that they have expressed their willingness to accept the services of a limited number of motor cyclists at the cavalry manoeuvres in September next. Motor cycling members of the Motor Union who would like to take part are requested to communicate at once with the secretary, 1, Albemarle Street, Piccadilly, W., stating whether they have had any military experience, and what machine they propose to use. The manoeuvres will take place in the neighbourhood of Oxford, from September 18th to the 23rd. Motor cyclists will be attached to the staff as dispatch riders. They will be provided with quarters, and they will have free messing and 6s. 6d. a day for expenses, petrol, etc. The War Office regard this as purely experimental, as they are anxious to test the usefulness of the motor cycle for military purposes.

THE AUTO CYCLE LEGION.

Early this month a letter appeared in various daily papers regarding a new motor cycle corps proposed to be formed. Mr. F. Straight, the secretary of the Auto Cycle Union, has now addressed a letter in reply, pointing out that the A.C.U. has formed the Auto Cycle Legion, with a view to placing at the disposal of the War Office a body of motor cyclists able to take an intelligent part in the defence of their country in a time of national danger. The A.C.L. is therefore already covering the ground suggested by Capt. E. Trevor Wright, and in the A.C.U. secretary's opinion it is undesirable to form another motor cycle corps which would necessarily tend to weaken an existing organisation. The following commands have already been established: London, Essex and Suffolk, Bradford and district, Manchester and district, Oxford and district, Glasgow, Kent, and Reading and district, and motor cyclists desirous of joining will be gladly put into communication with the commandant of either of the above districts.

THE IRISH END-TO-END RELIABILITY TRIALS on the 13th inst.

Competitors refreshing themselves at one of the controls.

INTER-CLUB HILL-CLIMB BETWEEN BIRMINGHAM AND OXFORD M.C.C.

The above event was successfully run off last Saturday at Irondown Hill, near Deddington, Oxfordshire. Teams of six were selected to represent each club. The results were worked out on A.C.U. formula, the Birmingham team easily proving winners. The first six best times were also made by the Birmingham men, who are now becoming quite *au fait* with hill-climbs and similar competitions.

Owing to obvious reasons, it was impossible to publish the venue of the climb broadcast, consequently there were few spectators, and there was no difficulty in keeping the course clear. The results are:

BIRMINGHAM TEAM.				
Name.	Machine.	Total weight.	Time.	Figure of merit.
Edwards (3 1/2 Triumph)	...	312 lbs.	42.2s.	64.4
Southam (3 1/2 Triumph)	...	319 lbs.	44.4s.	65.4
Troman (3 1/2 Triumph)	...	336 lbs.	48.8s.	69.2
Raper (3 1/2 Triumph)	...	312 lbs.	47.8s.	73.0
Fowler (5 Rex)	...	305 lbs.	37.6s.	89.4
Heath (7.9 Peugeot)	...	385 lbs.	42.6s.	109.0

Fowler made the fastest time of the day; he literally

appeared to fly up the hill. Edwards on his 3 1/2 h.p. Triumph for the second time this year made the best performance on formula; he is awarded Mr. Norton's prize, value £1 1s. Southam made third best time on his 3 1/2 h.p. Triumph, and would probably have done better but for the fact that he had a new cylinder out for the first time.

OXFORD TEAM.

Name.	Machine.	Total weight.	Time	Figure of merit.
Smith (2 3/4 N.S.U.)	...	305 lbs.	60.2s.	65.6
Braithwaite (3 1/2 Triumph)	...	305 lbs.	53.8s.	80.2
Betteridge (3 1/2 Triumph)	...	301 lbs.	54.0s.	85.4
Salter (3 1/2 Triumph)	...	319 lbs.	58.0s.	86.5
Matthews (3 1/2 Triumph)	...	319 lbs.	60.2s.	90.1
Moore (3 1/2 Brown)	...	312 lbs.	60.2s.	91.8

Braithwaite made the fastest time of the Oxford team on his 1907 Triumph, Betteridge coming second on his 1909 Triumph; both made very clean climbs. Smith on his 2 3/4 h.p. N.S.U. made the best performance on formula, and, considering the size of his engine, he made a very good show.

M.C.C. LONDON-LAND'S END-LONDON RUN.

The following entries have been received for the above run, which starts at 4 a.m. on Saturday next from Cranford Bridge, the competitors returning on Monday, August 2nd. Mr. Harry G. Bell, the trials hon. secretary, informed us that at least a dozen more entries were expected before the list was closed:

Harry G. Bell (3½ Triumph)	W. W. Douglas (2¾ Douglas)
Owen Summers (6 Acacia)	W. Watson (7 Vindec Special)
F. A. Hardy (3½ Norton)	G. Brough (5 Brough)
E. Gwynne (7 V.S.)	F. Mussell (3½ Rex)
A. T. Stanton (3½ Bradbury)	Dr. C. B. Moss Blundell
E. Clark (2¾ Douglas)	(3½ Nondescript)
G. Purchase (3½ Triumph)	H. Karslake (3½ Nondescript)
D. S. Baddeley (7-9 Baddeley)	W. Cooper (3½ Triumph)
L. A. Baddeley (3½ Yelladab)	H. Crole-Rees (6 Advance)
Stanley Webb (3½ Triumph)	J. V. Robinson (2¾ Douglas)
G. L. Fletcher (2¾ Douglas)	Hugh Gibson (3½ Triumph)

A.C.U. QUARTERLY TRIAL.

The third Quarterly Reliability Trial of 1909 takes place to-day (Wednesday) over the usual course from Uxbridge to Banbury and back, a distance of 125 miles. The competitors will be timed on Dashwood and Amersham Hills as before. The luncheon stop is at the Red Lion, Banbury.

The entrants are:

R. D. T. Wood (3½ Triumph)	S. Kempson Jones (3½ L.M.C.)
J. L. Norton (3½ Norton)	V. Underhill (3½ L.M.C.)
A. Brown (3½ Midget Bicar)	P. W. Bischoff (5-6 F.N.)
R. Bell (N.S.U.)	J. Seyfried (3½ Triumph)
H. D. Teage (3¾ Premier)	G. Simpson (3½ Bradbury)

C. J. Janssen (2 Moto-Rève)	

Six Days' Trials. A Correction.

G. E. Stanley did not pedal his 3½ h.p. Premier up the test hill, Blaenau-Festiniog, as stated in the Auto Cycle Union judges' report of the Six Days' Trials. As a matter of fact, his machine had no pedals, and we are assured that he made a clean ascent of the hill.

CLUB NEWS.

Middlesbrough M.C.C.

The reliability trial for the Ggers cup and club medals on Wednesday, the 21st inst., proved an unqualified success. The trial was over a distance of 205½ miles, and the competitors were allowed 11h. 20m. to cover the course, including one hour stop at York for dinner. A most difficult trial was planned, the men travelling from Marton Bungalow (the club's headquarters) to Guisborough, Ruswarp, Scarborough, York, Wetherby, Harrogate, Ripon, Northallerton, Ellerbeck, Yarm, Leven Bridge, and thence to Marten Bungalow, which course contains, amongst others, two very trying hills, namely, Birk Brow and High Leven Bank. The competitors were: E. Young (3½ h.p. Bradbury), R. Archdale (3½ h.p. Triumph), W. A. George (3½ h.p. Rex), J. Benjamin (2 h.p. Moto-Rève), W. E. Price (3½ h.p. Premier), Bennett (5 h.p. Norton), G. R. Sanderson (3½ h.p. Triumph), J. E. Grafton (3½ h.p. Rex), E. Rees (3½ h.p. Triumph), J. Bellerby (3½ h.p. Minerva), Wm. Danby (3½ h.p. Auto Moto), E. Nock, J. Tenford, J. Turner, J. H. Dale, and H. Fairgrieve (3½ h.p. Triumphs), R. Richardson (2 h.p. Moto-Rève), and J. Tennick (3½ h.p. Brown). J. H. Dale was awarded

With the appearance of daylight and the Cheshire roads matters improved considerably, and the going was first-rate. The awards for the competition are as follows: 1st, the Hutton Shield and club gold medal; 2nd, prize value £2 2s.; 3rd, prize value £1 1s. The following five riders ran to schedule time throughout, so necessitating another competition to find a winner: H. T. Wanklyn (3½ h.p. Triumph), Jack Haslam (2½ h.p. J.A.P.), J. A. Stacey (3½ h.p. Triumph), T. Durant (3½ h.p. J.A.P.), and T. Dunstan (3½ h.p. Rex). The following five riders having covered the course at an average of seventeen miles per hour qualify for the club's bronze medal: F. Dover (3½ h.p. Triumph), S. Sawyer (3½ h.p. Kelecom), H. W. Fawley (3½ h.p. Triumph), W. Barber (3½ h.p. Barber), and D. Bradbury (3½ h.p. Norton).

Manchester M.C.

Although the weather conditions were very unfavourable, a successful hill-climb took place on Saturday last. The venue was, as usual, in the Longendale Valley, close to Woodhead. Rain fell heavily most of the afternoon, accompanied with a gusty wind. The results on the handicap are: 1st, D.

The Manchester Motor Club's hill-climbing competition in the Longendale Valley, close to Woodhead.

A. J. Moorhouse, who rode a 5 h.p. Twin-cylinder Rex, is seen ready to start.

the cup and gold medal, and also the Triumph gold medal for the best performance on a Triumph machine, whilst other prize winners were: 2, E. Young, motor cycle riding outfit (presented by Stewarts, Ltd.); 3, R. Archdale, motor cycle head lamp (presented by W. Armstrong); 4, W. A. George (special prize presented by R. Richardson). T. Almgill acted as judge, and J. Dickenson as timekeeper.

Sheffield and Hallamshire M.C.C.

The club's reliability trial which took place on the 17th inst. created much local interest. The course was from Sheffield to Holyhead and back, a distance of 324 miles. This had to be covered at an average of eighteen miles per hour. Fifteen riders faced the starter, Mr. J. W. Gound, at midnight on Friday, the 16th. The night ride over the Derbyshire hills to Macclesfield proved most trying, the roads being for the most part greasy; moreover, a stiff head wind was blowing, causing the smaller-powered machines to have rather a rough time of it over the Cat and Fiddle.

Thomas (5 h.p. twin Peugeot); this rider also made fastest time. 2nd, P. Butler (5 h.p. twin Dot). 3rd, C. Kettle (3½ h.p. Triumph).

Essex M.C.

The members' hill-climb took place on Saturday last at Lippetts Hill, near High Beech. The results were:

SINGLE-CYLINDERS.

	Time in secs.	Formula.
J. Norton (3½ h.p. Norton) ...	X ...	34.7
R. M. Brice (3½ h.p. Brown) ...	24½ ...	37.0
F. G. Smith (3½ h.p. Triumph)16 ...	44.6

TWIN-CYLINDERS.

F. W. Applebee (5 h.p. Rex) ...	41½ ...	55.9
B. Siffken (5 h.p. Rex) ...	92½ ...	59.7
F. A. Applebee (5 h.p. Rex) ...	X ...	61.6

F. A. Applebee made fastest time of the day.

PASSENGER MACHINES.

	Time

R. M. Brice (5½ h.p. Brown, two-speed) ...	142½ ... 72.1

Club News.—

Newcastle M.C.

It has been decided to hold a non-stop run on August Bank Holiday to include a hill-climbing competition. Members are asked to communicate to the president any suggestions they can make for motor cycle events at the N.E.A.A. gymkhana, which will be held at Gosforth Park.

Coventry and Warwickshire M.C.

Saturday, August 21st, is the day fixed for the annual open hill-climb. The name of the hill will be made known a few days before the competition. This year two classes only will be included—Class I., for touring motor bicycles, single, twin, or four cylinders; Class II., for Tourist Trophy, racing, and special machines. A committee of scrutineers will inspect the machines and equipment in Class I., and their decision as to whether the machine can be classed as a full touring mount conforming to the rules will be final. Two cups and medals are the awards offered, whilst four extra prizes will be awarded for the best performances on formula and time by members of the Coventry and Warwickshire M.C. Applications for entry forms and particulars should be made to W. F. Grew, 19, Hertford Street, Coventry. Several motor cycle members attended the R.A.C. Warwickshire meeting on Saturday last, the visit to Warwick Castle and the concert and tea at Leamington being much appreciated.

Edinburgh M.C.C.

By permission of Col. Wardlaw-Ramsay, a speed contest was held on the avenue of Whitehill Estate, Lasswade, on the 17th inst. The avenue is of magnificent surface, and almost level, with the exception of one short hill of a gradient of about 1 in 14. The results are as follows:

Mile flying start (open to machines with engines of 505 c.c. or under).—1, A. H. Alexander (3½ h.p. Rex), 1m. 9¼s.; 2, A. H. Wilkie (3½ h.p. Triumph), 1m. 10¾s.; 3, R. A. Macmillan (5 h.p. F.N.), 1m. 20½s.

Mile flying start (open to machines with engines of 1,000 c.c. or under).—1, A. H. Alexander (3½ h.p. Rex), 1m. 7¼s.; 2, C. McGregor (5 h.p. Matchless), 1m. 10½s.; 3, A. H. Wilkie (3½ h.p. Triumph), 1m. 13½s.

One-third of a mile slow race (run off in heats).—Winner, D. S. Turnbull (5 h.p. F.N.)

Half-mile race (open to machines with engines of any capacity, run off in heats).—Winner, Campbell McGregor (5 h.p. Matchless).

Harrogate and District M.C.C.

Owing to the success of the last novel hill-climb promoted by this club, it was decided to hold another one on the same lines as before, and it proved quite as successful. The individual and aggregate times were as follows:

Rider and machine.		M. s.		Position.
W. Grange (3½ h.p. T.T. Triumph)	28¾s.	2	7½	1st
J. A. Tindall (3½ h.p. Triumph) ...	36s.			
H. Fortune (2¼ h.p. Ariel) ...	62¼s.			
E. R. Davies (3½ h.p. Rip) ...	54¼s.			
H. Addison (3 h.p. Triumph) ...	48¾s.	2	14	2nd
W. Fawcett (3½ h.p. T.T. Triumph)	31½s.			
C. Wilson (3½ h.p. Rex Speed King) ...	30¾s.			
*J. Bramley (3½ h.p. Triumph) ...	49¾s.			
G. Mackay (3½ h.p. Triumph and sidecar) ...	56½s.	2	16½	3rd
J. E. Brooke (3½ h.p. Triumph and sidecar) ...	56½s.			
F. Milner (3½ h.p. Triumph) ...	38¾s.			
T. Atkinson (3 h.p. Triumph) ...	48s.			
R. Breare (3½ h.p. P. and M. and sidecar) ...	76s.	1	52	5th
W. Turner (3½ h.p. Triumph) ...	36s.			
†F. Mackay (3½ h.p. T.T. Triumph) ...	—			

* Disqualified. † Non-starter.

The next competition will be held on August 14th, and will take the form of speed trials.

Nottingham and District M.C.C.

The 100 miles non-stop reliability trial for the Dennis-Bayley Challenge Cup Competition took place on Saturday over a course of 20¼ miles, which the competitors had to cover five times in all—three times in one and twice in the reverse direction. The competitors were started on the first three circuits at 2.15 by Mr. Scothern (hon. timekeeper).

The first of the competitors arrived on the second circuit within a few minutes of time. It was then noticed that there

were several absentees (Fairburn missing, also the holder of the cup—Pearson). Pearson came through twenty minutes or so late—belt trouble on hills.

Third circuit.—Still two more missing. Smith punctured badly, and Pearson fifty minutes late—magneto troubles.

Third circuit.—Competitors remaining in the running all arrived to time except Pearson, sixty minutes late.

After this third circuit all competitors stopped for tea, their machines being locked up. After tea a start was made in the reverse direction. About twenty minutes after the start

The 100 miles non-stop trials of the Nottingham and District M.C.C. for the Dennis-Bayley Challenge Cup. Competitors preparing for the start.

Reilly came back with punctured back tyre. Next to retire was Gee—ran out of petrol at eighty-five miles. The last half-circuit commenced with six competitors still in the running, namely, Lole, Claude Johnson, Birley Johnson, Geo. Brough, and Oswald Parker.

At the finish the stewards quickly checked the timesheets, and in less than half an hour the result was declared by the judge, Mr. Henry Bircumshaw:

- 1, Geo. Brough (5 h.p. Brough), cup and gold medal.
- 2, F. Birley Johnson (3½ h.p. Humber, two speeds), gold medal.
- 3, A. E. Lole (5-6 h.p. F.N., four cylinders), silver medal.

Yarmouth Club's Twelve Hours Reliability Run.

A 200 miles twelve hours' reliability run was held on the 15th inst. round Norfolk. The course was Gorleston, Yarmouth, Cromer, Hunstanton, Ely, Newmarket, Bury, Scole, Beccles, Oulton, and Gorleston. Out of sixteen starters fifteen completed the journey, of whom twelve arrived within the twelve hours allowed. The result was:

Rider and machine.		Marks lost.	
H. A. Lock (3½ h.p. Triumph)	2
A. Wyatt (4 h.p. Roc)	4
L. Gowing (4½ h.p. F.N.)	9
E. A. Hallinsteel (2¾ h.p. Wanderer)	10
H. R. Mayo (5 h.p. Vindec-Special)	14
G. H. Cross (2¾ hp. Anglian)	19
F. G. Galley (3½ h.p. Brown)	23
H. Collins (5 h.p. Roc)	40
N. Adcock (5 h.p. F.N.)	55
R. O. Clark (5 h.p. F.N.)	56
F. C. North (4 h.p. Roc)	66
C. F. Lacy (5 h.p. F.N.)	33

The three who finished outside time were: F. E. Bearwood (5-6 h.p. F.N.), broken footrests and lost his way; S. G. Allen (3½ h.p. Triumph), broken belt and lost his way; V. H. Blake (2½ h.p. Ariel), exhaust valve mechanism jammed and broken valve.

University of Birmingham M.C.

This club is holding a petrol and lubricating oil consumption trial of twelve hours running time around Birmingham on Bank Holiday, August 2nd. Members may enter for the consumption or reliability trials separately or together as both are run off at the same time. A gold medal will be awarded for the best performance in both trials. The chairman's prize will be awarded for most points in the reliability trial. Mr. West's prize will be given for best figure of merit in consumption trials. A start will be made at the New University at 8 a.m. sharp, and competitors are expected to be there by 7.30 a.m.

Club News.—

Bolton and District M.C.C.

The results of the re-run reliability trial are as follows: 1, J. Fishwick ($3\frac{1}{2}$ h.p. Triumph); 2, S. Groom ($3\frac{1}{2}$ h.p. Rex); 3, J. Nuttall (5 h.p. Vindec).

Bradford M.C.C.

The annual twenty-four hours' reliability trial for the Wm. Briggs Cup, value twenty-five guineas, resulted as follows: 1, T. G. Bullus ($3\frac{1}{2}$ h.p. Phelon and Moore), cup and gold medal; 2, Felix Scriven ($3\frac{1}{2}$ h.p. Rex), gold medal; 3, Chas. Sydney ($3\frac{1}{2}$ h.p. Phelon and Moore), gold medal. Messrs. J. Bottomley, O. Bocock, E. W. Lee, and W. Gilliard, qualify for bronze medals, and a special gold medal given by the R.O.M. Tyre Co. goes to T. Bullus for best amateur time schedule by non-trade rider. A prize given by the president (Mr. Johnson) goes to J. Bottomley for best performance outside gold medal winners.

Richmond and District M.C.

The reliability trial for the Carmichael Challenge Cup has been postponed until September 5th, when a run to Winchester and return will be made. Full particulars will be forwarded in due course to all members of the club. A picnic was arranged for Sunday last on Newlands Corner.

Western District M.C. (London).

Mr. F. H. Mullett having resigned the secretaryship of the club, Mr. Edwin W. Macbay has been elected in his place. Mr. Macbay's address is 9, Whitehall Road, Hanwell, W.

The competition for the Wingrove medal resulted in W. F. Ritchie (5 h.p. Vindec) and T. J. G. Babbage ($4\frac{1}{2}$ h.p. twin Minerva) tying for first place, both arriving dead to time and making non-stops both ways. S. Wood ($3\frac{1}{2}$ h.p. Triumph) was third, 20s. late, non-stop runs. It is expected that the tie will be run off at an early date.

North-west London M.C.C.

The correct results of this club's hill-climb on A.C.U. formula are as follows:

CLASS I.—Single-cylinder, any capacity.

E. A. Colliver ($3\frac{1}{2}$ h.p. Triumph) ...	+ $4\frac{3}{5}$ s. ...	90.00
W. O. Bentley ($3\frac{1}{2}$ h.p. Rex) ...	+ $7\frac{1}{5}$ s. ...	90.64
A. W. Bentley ($3\frac{1}{2}$ h.p. Triumph) ...	X ...	92.63
J. P. Le Grand ($3\frac{1}{2}$ h.p. Rex) ...	+ 13s. ...	101.17

CLASS II.—Multi-cylinders, any capacity.

S. R. Tyssen (5 h.p. Vindec) ...	+ $9\frac{2}{5}$ s. ...	108.00
Glynn Rowden (8 h.p. Bat) ...	X ...	140.41
Miles Brunton (5 h.p. Rex) ...	+ 27s. ...	143.07
C. M. Simpson (5 h.p. Vindec) ...	+ $20\frac{2}{5}$ s. ...	146.14
A. S. Phillips (5 h.p. Vindec) ...	+ $27\frac{2}{5}$ s. ...	156.41
A. Brunton (5 h.p. Rex) ...	+ $32\frac{3}{5}$ s. ...	217.29

The climb was held on Cop Hill, Princes Risboro'. The results given on page 549 last week were worked out on a different formula.

A petrol consumption trial held on the 17th inst. attracted fourteen entries, and was most successfully carried out on a very sporting course near Stanmore. The results, subject to being passed by the committee, are as follows:

1, S. R. Tyssen (5 h.p. Vindec); 2, E. A. Colliver ($3\frac{1}{2}$ h.p. Triumph); 3, G. H. Hollis ($3\frac{1}{2}$ h.p. Triumph); 4, T. G. Blundell ($3\frac{1}{2}$ h.p. Triumph); 5, C. A. Stern (4 h.p. N.S.U.); 6, H. V. Bate (5 h.p. Vindec and sidecar); 7, H. H. Berlandina ($2\frac{3}{4}$ h.p. Douglas); 8, Glynn Rowden (8 h.p. Bat); 9, H. V. Davidson ($2\frac{1}{2}$ h.p. Rex); 10, F. Fox (5 h.p. Rex).

The winner's mileage works out at 102 miles per gallon. The petrol was supplied by Messrs. Beard Bros., of Cricklewood. The club is very greatly indebted to Mr. R. G. Booth, who at great personal inconvenience assisted with his car the whole of the afternoon.

An inter-club hill-climb has been arranged with the Oxford M.C.C., to be held on August 14th.

On September 11th an inter-club competition with the St. Albans and District M.C.C. will be held. Particulars will be published later.

Walthamstow M.C.

The second annual competition for the Dinner Cup, over a course of 100 miles on the London-Newmarket road, was held recently. Twelve competitors started, and nine succeeded in making non-stop runs qualifying for the gold centre silver medals. The destination of the cup and gold medal was decided by a further ten miles run, during which the competitors were timed over a secret two miles, the competitor running nearest to the time allotted being declared the winner. Those who made non-stop runs were: J. H. Kerr (5 h.p. twin Rex), V. R. A. Wain ($3\frac{1}{2}$ h.p. Rex), Dr.

Start of the Yarmouth and District M.C.C. Twelve Hours' Reliability Trial from Gorleston-on-Sea.

(Photograph kindly sent by Dr. V. H. Blake.)

H. Samuel (5 h.p. Vindec and sidecar), F. A. Applebee ($3\frac{1}{2}$ h.p. Rex), A. T. Stanton ($3\frac{1}{2}$ h.p. Bradbury), G. Whitter ($3\frac{1}{2}$ h.p. Rex), F. W. Applebee ($3\frac{1}{2}$ h.p. Rex), R. J. Lises ($5\frac{1}{2}$ h.p. Humber tricar), and J. W. Percival (6 h.p. Fafnir tricar). In the final ten miles, R. J. Lises succeeded in finishing within three seconds of the schedule time, and was declared the winner of the gold medal and silver dinner cup. V. R. A. Wain was second, qualifying for the special prize given by the hon. secretary, Mr. J. W. Percival.

Motor Cycling Club.

The following official awards have been made in connection with the twenty-four hours' reliability run for motor bicycles, a report of which was published last week. The official awards confirm the report as far as the winner of the cup and the medals for private owners are concerned.

Silver cup presented by F. G. Jenkins and W. H. Wells: H. Karslake ($3\frac{1}{2}$ h.p. own make De Dion engine, N.S.U. two-speed gear).

Gold medals presented by E. Gwynne and C. J. Seed for three best performances by private owners: H. Davison ($3\frac{1}{2}$ h.p. Rex), Hugh Gibson ($3\frac{1}{2}$ h.p. Triumph), and W. Price ($3\frac{1}{2}$ h.p. Rex).

Gold medals presented by M.C.C. to every competitor completing full distance in twenty-four hours: J. S. Barratt (5-6 h.p. Chater Lea-Peugeot), G. Brough (5 h.p. Brough), C. Burton ($3\frac{1}{2}$ h.p. Vindec Special), C. C. Cooke ($3\frac{1}{2}$ h.p. Triumph), A. H. Forbes ($3\frac{1}{2}$ h.p. Triumph), E. Pond (5 h.p. V.S.), F. G. Smith ($3\frac{1}{2}$ h.p. Triumph), and A. J. Stevens (3 h.p. Wolf).

Newcastle and District M.C.

The team trial of three was held on the 18th inst. The route chosen this year was from the club garage *via* Spenny-moor, West Auckland, Barnard Castle, and Bowes, to Penrith (about seventy-eight miles out), and back by Alston, Haydon Bridge, Hexham, and Corbridge, to the club garage (sixty-four miles), being a total of 142 miles. There were twenty-one starters, making up seven complete teams. The object of the trial was of a sporting nature, the three riders in each team starting together and finishing together. It was thus incumbent on each individual member of a team doing his utmost to get his fellow members through the trial. The winning team was decided on accuracy of arrival of complete teams at the luncheon stop at Penrith, and at the club garage, based upon twenty miles an hour.

The winning team who timed in within four seconds of minimum time was as follows: R. B. Smith ($3\frac{1}{2}$ h.p. N.S.U.), Stan Hudson ($3\frac{1}{2}$ h.p. Premier), and R. Archdale ($3\frac{1}{2}$ h.p. Triumph).

The second team was G. W. Raper (6 h.p. N.S.U.), D. M. Mallett ($3\frac{1}{2}$ h.p. Excelsior), and C. Reinhart ($3\frac{1}{2}$ h.p. N.S.U.).

THE 1909 BRADBURY ON THE ROAD.

HAVING lately carried out a test of the $3\frac{1}{2}$ h.p. 1909 model Bradbury motor bicycle, we are in a position to speak very highly of its capabilities. The machine which the makers

sent to us for trial was not a new one by any means—we should say it had been ridden several thousand miles—but the way it romped up hills was an eye-opener. This was partly due to the big jet in the carburetter (proved by the rather high consumption), but this jet always enabled the engine to start readily at walking pace. There was no need to warm up the engine on the stand when starting for a run, for it never refused to start with the throttle barely open. The engine is a ball bearing one of 87 mm. by 87 mm., with interchangeable mechanical valves larger than any other engine of the same power, it is claimed. We cannot confirm this statement, not having had occasion to inspect them during the time the machine was in our possession.

The crank case forms the basis of the frame, and is constructed of a special steel casting, and open only on one side. This results in greater rigidity and strength. The flywheels are large, and render the engine extremely flexible. With this machine it is possible to crawl up to the foot of a hill, suddenly open the throttle and air lever, and away the machine bounds at full speed.

The frame is very low, the handle-bars extended well back, and footrests are fitted. These latter,

however, would be much more comfortable if placed a little lower. The spring forks are of special pattern, but the springs of the machine sent us were apparently intended for a rider of heavier weight, for there was

The 1909 pattern $3\frac{1}{2}$ h.p. Bradbury, with 87×87 mm. ball bearing engine

very little movement in them. Still, we have formed a very good opinion of the Bradbury after a test of 250 to 300 miles, for we never found a hill it could not climb, and the speed was always quite sufficient for our purpose. We cannot truthfully say that the machine was silent, for someone had unwisely enlarged the silencer outlet holes, although a cut-out is fitted. The actual machine we tried was afterwards successful in completing the 1,024 miles reliability trials of the A.C.U.

M.C.C. 24 Hours Reliability Trial, July 17th.

On the right, Harold Karslake (3 h.p. nonde script), winner of the Silver Cup presented by Messrs. F. J. Jenkins and W. H. Wells. Left, Hugh Gibson ($3\frac{1}{2}$ h.p. Triumph), who was a close second. Harry G. Bell, trials hon. sec. (centre.)

New pattern
3 h.p. cylinder.

GENTLEMEN,

TIPTON, STAFFS., 4th July, 1909.

You may possibly be interested in hearing the result of a further test to which I put your Automatic Variable Pulley yesterday. With the object of testing my old 1906 Quadrant which, as you will remember, you have recently overhauled, I rode down to Sunrising Hill with two friends, and succeeded in climbing the hill without any pedal assistance. The way the pulley responded to the gradient was astonishing, the engine speed remaining practically constant, even when rounding the sharp bend on the steepest bit at a slow pace. There was not the least trace of slip, although the engine was on full throttle. My friends admired the pulley very much, and had previously scoffed at the idea of my machine making the ascent. I had eight springs in pulley, and machine was in full touring trim, my own weight being about 13 stone.

Yours faithfully, H. T. P.

THE BAT MOTOR MANF. CO., Penge, London, S.E.

In answering this advertisement it is desirable to mention "The Motor Cycle."

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Appreciation of a Variable Gear.

[4152.]—As there are so many motor cyclists on the lookout for a good two-speed gear, it might not be inopportune to give my experiences with the Root and Clarke engine-haft gear which I have fitted to my machine. Although quite light in weight, the gear wheels are very broad, and it has stood up to the strain of a 7 h.p. engine for over 10,000 miles without showing a sign of wear. The clutch is very sweet in action and apparently capable of being slipped indefinitely, though once in, its grip is perfect. The gear is absolutely fool-proof.

FRANK THOMAS.

The Future of Passenger Motor Cycles.

[4153.]—I and a party of six passenger motor cycle owners, i.e., sidecars and forecars, will be at the Swan's Nest Hotel, Stratford-on-Avon, on Saturday, August 7th, at 5 p.m. It would be interesting and instructive if other Midlands sidecar and forecar enthusiasts would muster at the same time and place, to compare notes on fitment in the way of gears, lamps, and tyres. I shall, therefore, be glad if you will give this letter prominence.

A photographer will be in attendance to photograph each vehicle and its occupants, and, if you so wished, copies of these could be sent to your paper for publication, with a short description of the machine and its service. The meeting will be quite unofficial, and there will be no function of any sort.

W. A. MILLINGER.

We shall be pleased to receive the photographs and will give them our best consideration.—ED.]

Sunday Competitions.

[4154.]—I, with the majority of my club's members, am feeling very annoyed at the resolution recently passed by the A.C.U. condemning "Sunday" competitions. Surely the affiliated clubs are at liberty to hold competitions (not hill-climbs or races) without the grandmotherly legislation of the A.C.U., and I am of the opinion it is exceeding its powers. Of course, I refer to closed meetings, not open competitions.

Our members are nearly all employed in offices or are in such a position that they cannot take Saturdays just when they choose, and even when two o'clock comes there is lunch, change, getting home, and getting to the rendezvous. This all means time. Now how is it possible, after allowing for contingencies, say, to make a start at five o'clock and run off a 200 miles reliability trial in schedule time; it is unreasonable, and furthermore, these supporters of our competitions are after all the "live" members.

What harm can there be in starting at a certain time on Sunday for a schedule run to a spot selected, lunching, and getting back at a certain time? We do not parade with armlets and flags, but simply hold a harmless reliability run. What is the difference between that and going an ordinary touring run?

The sooner the A.C.U. rescinds such "silly" resolutions the better, otherwise my club seriously contemplates withdrawing its support. We look forward to reports of our doings in your valuable journal, as they tend to increase

our membership, and I sincerely hope you will not pander to the A.C.U. in this matter, as it still inserts the Sunday doings of affiliated clubs in the *R.A.C. Journal*. I apologise for this lengthy letter, but I can assure you we feel very angry in this matter.

WILSON PROSSER,

Chairman Western District M.C.

The M.C.C. Twenty-four Hours' Reliability Trial.

[4155.]—Might I suggest that the next time the M.C.C. hold this trial it favours a route where it does not cover the same ground twice during the night. I live on the Henley-Oxford main road, and on the night of July 16th I was kept awake the greater part of the time by the machines roaring through the village with their cut-outs open. I should not have minded if they had only come through once. I am not an anti-motorist, as I ride a motor cycle and drive a car.

SURGEON.

[4156.]—I feel that some recognition is due to Mr. Hugh Gibson for his very sportsmanlike behaviour in the above competition. As is stated in your report, he was only two marks from me on the losing side after the third round, and stood a very good chance of winning, as he had a much better watch than I. Yet on the two last rounds he was sportsman enough to give me the exact time five miles from home, so that we should both have an equal chance as regards time. It is such instances as this that promote the good fellowship which exists amongst motor cyclists, and I cannot find words to express my admiration. I may perhaps mention that I had only met him once previously, when on the last London-Edinburgh run we rode together from Stamford to Edinburgh.

It may interest your readers to know that the machine I rode has done nearly three years' hard service, and has done about 18,000 miles without once failing me. The only adjustment during the trial was to replace two links in the Whittle belt at Oxford on the fifth round. I think it is safe to claim that this is as little as any other competitor did to his machine.

HAROLD KARSLAKE.

Repairs and Replacements.

[4157.]—Referring to the letter of Dr. Charles S. Patterson, M.B., M.R.C.S., in the issue of July 14th, 1909, I am glad to be able to state that I have proved the Humber motor bicycle to be interchangeable. I have one of their 1909 3½ h.p. models, which I find to be an excellent machine, and will take sidecar anywhere. On two or three occasions I have wanted replacements, and in each case I have received them per return, and they have fitted exactly, so that I could put them in myself, and what is more I have found the Humber Co. a most obliging firm. At Whitsuntide I was passing through Coventry, when I thought my machine required a little adjustment; I took it to the works, and the firm immediately put three mechanics to work at it, who found out that the engine simply required cleaning, which they did while I waited, and for which they made no charge. I think the doctor might do worse than purchase a 1909 Humber.

WALTER BUCKERIDGE.

Hill Climbing.

[4158.]-In the issue of *The Motor Cycle* dated July 14th, 1909, a correspondent writes of Mow Cop Hill, near Congleton. Two enthusiastic motor cyclists journeyed there from Winsford, Cheshire—Messrs. Arnold Stubbs and Clement Kitchen. We were both riding $3\frac{1}{2}$ h.p. Standard 1907 Triumphs, geared $5\frac{1}{2}$ to 1. Mr. Arnold Stubbs negotiated the hill successfully with pedal assistance at the second attempt. The first attempt failed, and the failure was due to a slipping belt. Mr. Kitchen also successfully climbed the hill, after repairing a burst tyre and putting in a new belt fastener.

We agree with all your correspondent says about the condition of the road surface, especially just as we began to climb the last and steepest portion. It was simply awful. In fact, we spent a few minutes removing some of the biggest boulders to give us a better chance.

The innkeeper at the Railway Hotel assured Mr. Stubbs that his was the first single-gear machine that had ever climbed the hill. Needless to say we both very proudly entered our names in the visitors' book spoken of by your correspondent. We referred back carefully, but failed to find any previous record of a single-gear single-cylinder motor cycle ever having climbed the hill. The date was Wednesday, July 14th.

ARNOLD STUBBS.
CLEMENT KITCHEN.

Passenger Machines in the Thousand Miles Trials.

[4159.]-I am surprised that no passenger vehicle gained an award in the 1,000 Miles Trial, as I feel that I could have pulled my twin and sidecar through, but perhaps I am underestimating the difficulties of such a test. It may interest your readers to know of the satisfaction I have experienced with my twin Rex de Luxe and Mills-Fulford fixed wheel sidecar. I have been riding this combination continually this summer, and have had excellent results. On the level I can do thirty-five miles if required, and take most ordinary hills on the top gear, and any hill (up to now) on the second speed. My two-speed is a Rex Roc adapted gear, and has worked very sweetly indeed. I use a Whittle belt, and as I have had previous experience of rubber and canvas belts for sidecar work, my opinion is that a Whittle will wear out several rubber ones.

I have read a lot of correspondence about skidding, and must say that I have ridden fixed wheel sidecars both in 1907 and 1909, over very greasy surfaces, bad corners, and tramlines, and have not had anything approaching a skid. With regard to steering, if care is taken in adjusting the sidecar in line with the cycle, one can release the steering bar on the level for some distance, but of course when steering round a corner to the left particularly (sidecars are usually fixed on the left) the speed should be kept down so as to negotiate it without any undue strain on the combination. With regard to safety, I have ridden at varying speeds over bad roads with heavy passengers and have never had broken tube or connection—and the explanation I think is a first-class machine and sidecar, and careful and firm adjustment. It is advisable to keep an eye on nuts and bolts, as vibration will work nuts loose.

I have not the slightest connection or interest with any firm in the motor trade. W. A. MILLINGER.

The Lightweight Question Again.

[4160.]-It seems a little late in the day to be called upon to defend the lightweight motor cycle, but it is impossible to let the remarks of "Ex-lightweight" in your issue of July 14th pass without comment. I have used motor cycles since their inception, and have owned most of the best-known makes, but till the present year I did not know what comfort, ease of handling, and economy of upkeep in a motor cycle meant. My experience of these things has coincided with my purchase of a lightweight. Perhaps "Ex-lightweight" and I are somewhat at variance as to what we mean by a "lightweight." He had a $1\frac{1}{4}$ h.p. motor; mine is a Douglas $2\frac{3}{4}$ h.p. But he says he now wants a machine weighing from 160 to 180 lbs. The Douglas weighs just 100 lbs., and from it I get everything, and a great deal more than he gets from his $3\frac{1}{2}$ h.p. As my last mount was a 1908 machine, I claim to know what a really good $3\frac{1}{2}$ h.p. motor cycle is; but for everything that makes motor cycling enjoyable the heavy single-cylinder motor cycle is not to be compared with the light $2\frac{3}{4}$ h.p. twin. I have covered over 3,500 miles with mine, and that in Scotland, where the roads are calculated

to bring out any inherent vices of an engine, so that I may fairly claim to know something of the possibilities of the machine.

My only previous lightweight was a 2 h.p. Clément-Garrard, and I confess that I did not like it; but the Douglas sacrifices neither comfort nor stability to lightness. Mine has footrests, $2\frac{1}{2}$ in. Palmer Cord tyres, spring seat-pillar, and Brooks double-sprung saddle. It is, in fact, positively luxurious to sit upon. The wheelbase is long, and the saddle position low. Then it starts at once—almost as easily as a push-bicycle, in fact. As for speed, I find that I can now get from 5 to 35 m.p.h. out of it. It takes me up any hill that my 1908 machine would take me up. It does not side-slip, and there is no vibration whatever from the engine. To ride it is like perpetual free-wheeling.

I write this letter rather reluctantly, and it is only a sense of fair-play that induces me to do so. In Scotland the Douglas

Ivan B. Hart-Davies, of Rugby, on arrival at Land's End, after his record run from John-o'-Groat's in 33 hrs. 22 mins. How long will the record stand? We may be able to answer the question in the next issue.

is not yet well known, and one has a certain amount of selfish satisfaction in owning a good thing that other folk have not had sufficient gumption to pick up. But the makers of motor cycles get (deservedly) plenty of abuse from we riders, and I think that praise, when it is merited, will probably prove an equally effective stimulant to good work.

GEORGE A. MACKAY.

[4161.]-In reply to your correspondent "Ex-Lightweight" [letter 4140] I should like to ask him if he is aware that there are other lightweights than $1\frac{1}{4}$ h.p., viz. 2 h.p. Moto-Rêve and $2\frac{3}{4}$ h.p. Douglas. As soon as he has given either of these machines a 500 miles trial I venture to say he would not readily go back to the heavyweight. I recently purchased a $2\frac{3}{4}$ h.p. Douglas which is eminently satisfactory in all respects as regards easy starting, speed, hill-climbing, and getting about amongst traffic in busy thoroughfares. If "Ex-Lightweight" would like to test his $3\frac{1}{2}$ h.p. against my $2\frac{3}{4}$ h.p. Douglas through traffic and on a long journey I shall be very pleased to meet him any time by appointment, and feel sure the little Douglas will not be second throughout a fifty miles journey.

AN 863.

[4162.]-I am afraid that letter 4140 may mislead intending motor cyclists as to the merits of a good lightweight. I am the amateur owner of a lightweight, and although it is a lightweight it leaves nothing to be desired in regard to reliability, comfort, speed, and power. I suppose this is all that is required for touring purposes. This lightweight will easily carry me (9 stones 9 lbs.) and a passenger on the carrier (12 stones) up such steep inclines as Ashley Hill, Bristol, without pedalling and without a two-speed gear. The arrangement of the engine—being a twin-opposed—

mpletely overcomes the vibration from which the average $3\frac{1}{2}$ h.p. heavyweights suffer. The engine never fails, and barring stoppages with punctures or belt troubles I am able to go any journey of 150 miles in a day in England, Wales, and run close to schedule at three or four checks every twenty miles an hour average, and I am as certain of getting to my destination as I should be in a train. I say this because I have ridden my lightweight—a $2\frac{3}{4}$ h.p. Douglas—many thousands of miles.

ARTHUR J. LUMBERT.

Silence.

[4163.]—Letters 4034, 4076, and 4141 concerning silence have interested me. The writers may like to hear of my experiments concerning silence. After trying all kinds of silencers, mostly of the cylinder kind, with one, two, and three fans in them to chop up the sound, I have at last found an efficient silencer. It consists of 5ft. of $1\frac{1}{2}$ in. diameter tube fitted to an engine $82\frac{1}{2} \times 89$ mm. with 5 to 1 gear ratio. A butterfly valve is fitted in the extreme end of the pipe. The following are fractions of a square inch which the butterfly valve is opened.

I can run the machine at fifteen or twenty miles an hour on a good road on a valve opening of $\frac{3}{8}$ in., twenty to thirty miles per hour on $\frac{1}{2}$ in. opening. The exhaust is so silent at the hum of the magneto chain can be heard quite easily, and people stop to look at the machine as I pass by. Although the valve when closed fills the tube, to the one-hundredth part of an inch, the engine will run well at about 10 miles per hour, and fire about once in three. Opening the valve to half a square inch or more, the noise made is only like a large car. The momentum of the exhaust gas going through the tube has a tendency to scavenge the engine and dissipate the heat. There is absolutely no exhaust sound up to a quarter of an inch opening of the valve.

HENRY GRAFTON.

The Berlin Track Disaster.

[4164.]—I enclose a cutting from a daily paper describing the above, which you may probably have read. The disastrous accident, to my mind, is yet another instance of the folly of these excessive speeds, which a few men in this country (probably for personal gain, e.g., £50 cups and trophies) are still willing to uphold. Motor cycles have now reached a pitch of perfection sufficient to enable them to run speedily and consistently throughout all weathers and over nearly every class of road, and many of us have yet to learn the advantage of breaking some previous record by one-fifth of a second round some track.

It was once mentioned in your columns by a professional rider, as a defence of long-distance records on tracks, that probably no amateur would succeed with his touring machine, but before treating such a remark as other than a joke, I should like to hear what percentage of motor cyclists have bought machines with the idea of sitting on them for any time approaching twenty-four hours.

No doubt while there are cups given for such performances we shall always have the cup-hunters. Probably, when the track speeds reach about 90 to 100 m.p.h. on an average, a family grave will be offered as an inducement to professionals to compete.

CLEMENT G. CADY.

We have read several reports of the above regrettable disaster, and, although some mentioned that the dead and dying lay all around and other similar sensational statements, we believe the fatalities were whittled down in subsequent reports to three. We would remind our correspondent that men will always be ready to race, whether on horse or motor cycle, in yacht or flying machine, and a man was even unfortunate enough, a few days ago, to be killed whilst reposing in his armchair by the chimney of his house falling upon him. It so happened that in the Berlin disaster the spectators suffered most.—ED.]

Lubrication.

[4165.]—"Oile's" letter [No. 4058] regarding the oiling of a 1908 Triumph is interesting, and to expect a machine to run sixty to eighty miles without lubricating is, to say the least, tempting providence. Of course, it must be remembered that when a machine is sent out from the makers it invariably has a liberal supply of oil in the crankcase, and this be further added to by the rider, which is usually

the case, it naturally follows that the engine will run for a longer period without needing further lubricant. "Oile" does not say how much he had in the crankcase when he started, or what quantity was found in the crankcase after the abnormal runs.

I presume the oil tap does not leak, and that the same was turned right off, as with this type of machine, if it be left on, the oil will continue to run down into the crankcase. I would like to ask what condition the cylinder was in immediately after the long runs? Also, did "Oile" record his mileage upon a cyclometer?

H.G.

[4166.]—Mr. McMinnies's interesting article in a recent issue, particularly the paragraph criticising the "rough and ready" system of lubrication in vogue on present-day motor cycles, has prompted me to mention the result of my experiments, extending over a long period, with a view to perfecting a really automatic system of lubrication.

It is readily acknowledged, by those who have closely studied this question, that any method based merely on a drip feed is inaccurate, wasteful, and inefficient. Recognising this, also that a pump and sump add unnecessary complications, I concluded that the only way to maintain a constant minimum level of oil in crank case was to utilise the well-known principle of the bird water fountain. No good purpose would be served by stating here the various difficulties encountered in adapting this principle; but with certain modifications, which are the subject of a final application for a patent, and which it would be inadvisable to detail at present, the most gratifying and successful results have been obtained. Utilising the present hand pump for filling, a small, auxiliary, airtight tank, containing about twelve pumpfuls of oil, is attached close to the crank case of engine, a feed pipe connecting crank case with tank. The feed is self-starting and uninterrupted by any needle or other valve.

The action of this system depends upon the air pressure in crank case, i.e., the down stroke of piston causing air pressure in crank case forces a few bubbles of air into the airtight auxiliary tank, thereby releasing from the partial vacuum in the tank a corresponding quantity of oil which is immediately drawn into the crank case by the upward stroke of engine piston. This operation is repeated until the level of oil in crank case covers the feed hole, thus forming an air seal, preventing further admission of air to auxiliary tank until the supply of oil in the crank case is consumed.

The advantages of this method of automatic lubrication are:

- (1.) The supply of oil is accurately proportional to engine consumption.
- (2.) The flow of thick "air-cooled" oil is unaffected by cold, the tank being warmed by its proximity to the hot crank case.
- (3.) Economy of consumption and consequent freedom from charring.
- (4.) No complication or working parts.
- (5.) Extra oil given when hill-climbing.

I may say that the above system has been in use on my $2\frac{1}{2}$ h.p. engine during this season, giving perfect satisfaction. A charge of twelve pumpfuls sufficed for a long run recently of 240 miles, leaving a quantity remaining in tank on completion of the run.

The result of my placing practically this invention before two of the principal British manufacturers of motor cycle engines has not been encouraging; but I live in hope that when the system is more widely known by my long-suffering fellow motor cyclists its adoption by progressive manufacturers will speedily follow.

E. ALLAN GLEN.

EXPERIENCES WANTED.

"5799" would like readers' experiences with the Centaur chain-driven motor bicycle, its faults as well as its good points.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

THE 3½ h.p. EXCELSIOR MOTOR BICYCLE.

AS already announced in *The Motor Cycle*, the firm of Bayliss, Thomas, and Co., Coventry, has recently revived the manufacture of the Excelsior motor bicycle. The management of the concern very kindly placed at our disposal a few weeks ago a brand new machine which had never been ridden except for a test ride to see that everything was in order. This we commenced riding at once, and from the first were favourably impressed with its behaviour.

The engine is 82 × 89 mm., with mechanically operated inlet valve and Bosch magneto, gear driven. The magneto is placed in a most accessible position, and during the time we rode the machine we did not notice any noise arising from the magneto driving pinions, which are enclosed in an oiltight case forming part of the crank case of the engine. The frame is low, well built, and highly finished, tanks being in duplicate—that is to say, they are fitted one on each side of the top tube, and so constructed that they entirely enclose the tube and present a very neat appearance. One petrol tank is connected to the other by means of a branch pipe, and it is possible to run on both or one tank as desired. In the case of a somewhat absent-minded rider it is advisable for him to run on the large tank, and provided both are full when he starts he will have the smaller one to fall back on if the larger one becomes empty when there are no petrol stores in the vicinity.

The spring fork is the well-known Druid, and there is no question of doubt that this renders the machine most comfortable to ride on rough roads. The wheels are the standard size 26in. × 2¼in., and, of course, any tyre can be supplied to order. Those fitted to the machine we rode were Dunlops, and they gave no trouble in the course of about 500 miles. The front brake and exhaust valve lifter levers and rods are splendidly designed and work beautifully. No

feature of the machine is better than these. The sparking plug is fitted over the inlet valve cap, and the paraffin compression tap over the exhaust valve. The engine is particularly well balanced, and at high speeds one cannot detect any undue vibration, while it will run almost as slowly as it is possible for the

The 1909 pattern 3½ h.p. Excelsior, with 82 × 89 mm. engine, Bosch magneto, Druid spring forks, Lycett saddle, and Brown and Barlow handle-bar controlled carburettor.

machine to be balanced with a gear of about 4½ to 1. The carburettor is a Brown and Barlow with handle-bar control. Any description or remarks with regard to this well-known device would be superfluous, as practically every motor cyclist knows its capabilities. It will suffice to say that, with the aid of the handle-bar levers, the machine can be regulated to run at widely varying speeds, and with a fairly heavyweight rider in the saddle—13 to 14 stones—it will climb main road hills at high speed. To those motor cyclists who are on the look out for a reliable mount at a moderate figure we can recommend the 1909 pattern Excelsior, which is manufactured and sold by Bayliss, Thomas, and Co., Coventry. It possesses all the essential details of a modern single-gear motor cycle.

HANDLE-BAR WATCHES.

MOST motor cyclists carry a watch on the handle-bar, especially when on tour, for it is surprising how the time slips away when riding along with no fixed object, simply admiring the scenery. Some watches, however, will not stand the vibration of a motor cycle for long. On the other hand, it is hardly wise to use an expensive watch. Therefore there is an opening for a strong, serviceable watch, which must

be non-magnetic. The "Wunda" watch and holder recently submitted to us is a marvel of cheapness. The watch keeps good time, and the nickel-plated case has been well thought out. It will be seen from the illustration that a spring is fitted to absorb some of the vibration, and another good point is the secret fastening used. It is sold by Bransom, Kent, and Co., Ltd., 40, Great Eastern Street, E.C.

Messrs. J. C. Lyell and Co., Ltd., 55, Victoria Street, Westminster, S.W., have submitted to us a new pattern Clair silencer. The cut-out fitted is variable, and by its use almost perfect silence or any degree of noise can be obtained. The silencer for a 3½ h.p. engine is rather large, but it will keenly interest readers who would like to make their motor cycles silent.

The ROC

commonly designated "the car on two wheels," has been silently and surely proving its utility during the 1909 season. In the recent six days' trials three machines fitted with the ROC live axle clutch and two speed gear completed the distance without loss of marks. The performances of these machines were specially conspicuous at the official hill climb observations. ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀ ❀

ROC and Economy.

At the Ayr and District Motor Club's Trial, a twin ROC came out first on formula, and also ran the greatest distance to the gallon, viz., 85 3 miles. ❀ ❀ ❀ ❀ ❀

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—9d. per line of 8 words; minimum, 3 lines. Name and address must be counted.

Two lines (16 words or less) costs 1/6
Three lines (24 words or less) costs 2/3
Four lines (32 words or less) costs 3/-
In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.
All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. Ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Thursday morning, or if sent to London (20, Tudor Street, E.C.), by the Wednesday afternoon previous to the date of publication.

All letters relating to advertisements should be distinctly under what heading and in what column the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going there to view.

The following showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Nottingham, Lincoln, Leicester, Rutland, Northampton, and Warwick.

SECTION V.
Norfolk, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.
Worcester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.
Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, and Channel Islands.

SECTION VIII.
Hertford, Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.
Somerset, Devon, Dorset, and Cornwall.

SECTION X.
Scotland.

SECTION XI.
Ireland and Isle of Man.

MR. HART DAVIES

used our

FAMOUS . . . SEARCHLIGHT

when so handsomely breaking
the

John-o'-Groat's Record.

He chose the **BEST LAMP**—full of **EFFICIENCY** and devoid of **FADS**.

It was not a special lamp—in fact we did not know what lamp Mr. Hart Davies was using until after Record was beaten.

N.B.—This SPECIAL MODEL CAN ONLY be obtained from the PREMIER MOTOR CO.

ALL OUR GOODS ARE SENT ON APPROVAL

Premier Motor Co. Ltd.,

Aston Road, BIRMINGHAM

Telephone 4310.

Telegrams: "Primus, B'ham"

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle." When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be forwarded for replies. Only the number will appear on the advertisement. Replies should be addressed, 2d. c/o "The Motor Cycle," Coventry"; or if "London" is added to the address, then to the number given, "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown parties may deal in perfect safety by availing themselves of the Deposit System. If the money be deposited with "The Motor Cycle," other parties are advised of this receipt upon intimation of the arrival and acceptance of goods, the money is forwarded less a charge of registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. Deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Messrs. Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive no answer to their enquiries are requested to regard this as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to one by post.

MAUDES' Motor Mart have six only brand new guaranteed 3h.p. N.S.U.'s, with magneto ignition, to offer; makers' price £37, our's £25 5s. nett, cash only; only six left.—To be seen on the road at 136, Great Portland St., W.

5½ h.p. N.S.U., with two-speed, late 1907, £20, no offers entertained; N.S.U. lightweight, 1908, magneto, weight 84 lbs., guaranteed, £15, no offers; twin Werner, new coil and accumulator, lamp, horn, £10, offers.—Gotto, Portslade.

TRIUMPH, 3½ h.p., late 1907, magneto, 1909 handle-bar control carburetter, spring forks, Palmer tyres, cord back, Mabon clutch, absolutely perfect throughout; only ridden 1,000 miles; carefully kept; £28.—294, Kennington Park Rd., S.E.

3h.p. Kelecom, low frame, Ukantes stands, footboards, enamelling and plating perfect, £12 12s.; 3½ h.p. Kosmos, splendid condition, £14; good allowance for old machine: 1909 Triumphs, Moto-Reves.—Godfree's, 124, Romford Rd., Stratford, E.

MOTO-REVE, 1909, as new, faultless, low built, ridden 300 miles, spring forks, adjustable pulley, handle-bar control, trip cyclometer, Lucas lamp, new, lot of sundries; cost with extras over £46, bill shown; take £35.—Emery, 35, Beethoven St., Queen's Park, London.

5½ h.p. 1908 N.S.U. and coach-built sidecar, magneto, 32 spring forks, two-speed gear, and free engine, in excellent running order, 2½in. tyres throughout, nice taking appearance, and a magnificent example; £35 the complete turnout.—Wanchope's, 9, Shoe Lane, Fleet St., London.

MOTOR BICYCLES FOR SALE.

BARGAIN.—3½ h.p. White and Poppe, Chater frame, spring forks, pedals, new rubber studded back, 100, new condition, £16; also Liberty sidecar, £4; can be seen any time.—176, St. George St., London, E.

1 h.p. M.M.O., Chater No. 6 frame, no pedals, spring 2 brass-edged footboards, comfortable and reliable machine, perfect condition; £16 10s., no offers; sidecar same, £3 10s.—R.F.S., 5, Tarver Rd., Waltham, S.E.

1 h.p. Quadrant, surface carburettor, built for advertiser, 1905, with latest spring forks, two accumulators, new rubber belt, Clincher tyres, Brooks saddle, 100, spares, and tools; seen and tried by appointment; £10s.—2,874, The Motor Cycle Offices, Coventry.

MR LEACOCK, 121, Beaufort St., S.W., wishes to sell his 5 h.p. Vindec Special (1908), two-speed car, handle-bar control, Michelin studded back tyre, fitted tubes, lamp, horn, etc., enamelled grey, Truffault spring forks, perfect condition; £45.—Garaged at auchope's.

PRACTICALLY NEW 3 h.p. N.S.U., magneto, 24 Peter-Unions, 26in. wheels, all tools, lamp, horn, etc., enamelling and plating not scratched, fine running order, guaranteed not done 150 miles; selling, ill-health; £4 10s., all complete, great bargain.—Benn, 105, Bolver St., W.

1 h.p. Triumph throughout, just been thoroughly overhauled, replated and enamelled, new tyres, Michelin front, Clincher rubber studded back, new lamp, generator, and horn, stand, carrier, toolbag and tools.—Seen at 7, Park Hill Rd., Croydon. Trial by appointment any evening, except Thursdays, after 6.15.

1 h.p. Vindec Special, Truffault forks, Clincher studded tyre front wheel, Michelin steel studded rear, fitted with stand, carrier, toolbag, and spares, Stanley-Dermagne belt, adjustable pulley, cane upholstered sidecar fitted, Palmer tyre on wheel, extra wide mudguard fitted; £10, bargain.—Pond, 349, West End Lane, Hampstead, London.

ZENITH Motors, Ltd.—Clearance bargains. New Zenette, Gradua gear, 1908; new Zenette, Mahon clutch, 1908; new Zenette, free engine, 1908; new shop-fitted Zenette tricar, with three speed gear, 6 h.p. J.A.P. engine; also 1908 Triumph, fitted with Gradua gear. Particulars and prices on application, 1, Church St., Leybridge.

6 h.p. Twin Peugeot, No. 6 Chater frame, latest Chater stand, carrier, footrests, foot brake (pedals fitted), and thumb-slice control, guaranteed genuine, new tyres, Palmer cord and Michelin, H. Longuemare, n. Dermatine, Advance pulley, Brooks saddle, two accumulators, enamelling and plating perfect, fine machine; 25 guineas, or near.—27, Montford Place, Kensington, S.E.

SECTION IX.

Somerset, Devon, Dorset, and Cornwall.

1 h.p. Tuckville, twin-cyl., air-cooled; £15, or exchange cinematograph.—Mockridge, George St., Bridgwater.

MOTO-REVE, latest model, splendid condition; £26; owner getting 2-seater.—Lillicrap, 7, Carlisle Av., Plymouth.

1 h.p. Peugeot, Dunlops, low position, Watawata 2 belt, sound condition; £9.—40, St. Michael's v., Yeovil.

QUADRANT, 1909, 3½ h.p., perfect, unscratched, Palmers, Riches, Brown-Barlow carburettor; £36.—Thorne, Brunswick, Tiverton.

3 h.p. Brown, spring forks, 26in. Palmers, lamp, horn, toolbag, Dermatine, two spares, long, low, powerful; £10.—E. G. Reeves, Clevedon.

MINERVA, 3½ h.p. engine (De Dion), new Palmer cords, belt, etc., spring forks, splendid condition; bargain, £13 15s.—Varcoe, West End, St. Austell, Cornwall.

1 h.p. 4-Cyl. F.N., 1908 improvements, footboards, recently overhauled, new magneto (cost £6 10s.), 100 miles gallon, good tyres, spare tube, valves, etc.; £27; reason for sale.—Moore, Elmside, Sherborne.

REX, 3 h.p., everything in good condition, £8 15s.; Excelsior lightweight, 1½ h.p. Minerva, good condition, £6 15s.; Victoria ditto, 1½ h.p. Fafnir, engine alone worth more, 65s.; offers, exchange.—Edwards, Corporation St., Taunton.

SECTION X.

Scotland.

GLASGOW.—Templeton Bros., 535, Sauchiehall St., carry a large stock of second-hand machines; low prices.

GLASGOW.—Roc (two-speed), 9 h.p. Bat, 3½ h.p. N.S.U., lightweight Rex, etc., etc.—Templeton Bros.

1 h.p. Fafnir, fast, low, powerful, all spares, almost new; no time to ride.—Laurie, Kirkcowan, Wigtownshire.

1 h.p. Brown, Clincher tyres, spring pillar, splendid hill-climber, perfect condition; £10.—Emond, 7, Well St., Paisley.

1 h.p. Alert, No. 6 frame, accumulator ignition, 26 by 2 Avons, Antoine engine, Advance pulley, all 1909, less engine, saddle, spares; exchange high-grade cycle; £6, offers.—Broadfoote, Plantainside, Sanquhar.

EDINBURGH.—The permanent Scottish motor cycle show. Rex, V.S., Moto-Reve, Griffon, Norton, Zenith, Minerva. We stock all these, and can supply any other make; liberal exchange allowances.—Alexander's Motor Exchange, 110, Lothian Rd., Edinburgh.

6 h.p. Sarolea, open frame, wheel steering, two spares, £14.—13, Victoria Rd., Charlton, S.E.

RALEIGHETTE Tricar, 3½ h.p., late pattern; bargain.—Stimpson, Stratford-on-Avon.

TRICAR, in excellent condition; to be sold, a gain.—Moor View, Barton Rd., Torquay.

6 h.p. Rex Tricar, perfect condition, foot clutch; —36, Stroud Green Rd., Finsbury Park, N.

6 h.p. Twin Rex Litette, magneto; sell, or exchange motor cycle and cash.—315, Hessle Rd., Hull.

5½ h.p. Clement-Garrard, three speeds, just the 1 for serious touring.—27, Kingsbury Rd., Dalston, N.E.

REXETTE, open frame, two-speed, exceptional condition; £16; trial; write first.—Cumming, 39, Crown Rd., S.W.

4 h.p. Tricar, Kent-two-speed, handle starting, clutch, coach-built; £18.—Cooke, 45, Sankey Warrington.

6 h.p. Quadrant Carette, latest model, free engine, speeds, air-cooled; trial; £33.—Glendene, St. Rd., Leyton.

MINERVA Tricar, 3½ h.p., perfect condition, P. tyres; £15; trial given.—99, Sandringham Dalston, N.E.

GARRARD, three speeds, worm drive, coachbuilt excellent tyres; £22, bike part.—2, Boundaries sions, Balham.

6 h.p. Carette, Longuemare, new tyres, excellent; £27 10s.; 4 h.p. Rover tricar, £21.—31, L Rd., Stockwell.

10 h.p. Rexette, specially built, real beauty; 4½ Fullast particulars, Manning, 360, Green I Finsbury Park.

RUNABOUT, 3½ h.p., wheel steering, handle sta very good condition, light; £12 10s.—128, Rd., S. Tottenham.

4½ h.p. Riley, free engine, coach-built, fine cond excellent running order; exchange for £15.—128, High Rd., Tottenham.

4½ h.p. Twin Minerva, coach-built front, pan seat, Palmers; £20.—128, High Rd., Totter

£18.—Tricar, 4½ h.p., Phoenix two-speed and free engine, coach-built front, good running.—83, H head St., Southport.

MUST be Sold, 3½-4 h.p. Humber tricar, free engine, good condition; £12, or near offer; seen any ti 110, Pages Walk, S.E.

REXETTE, 6 h.p., two speeds, wheel steering, built, brass lamps; £29; open to any t. Hieatt, Witney, Oxon.

LATEST Rex Litette, 6 h.p., twin, water-cooled speeds, magneto, clutch, perfect; £39.—406, ratt Lane, Wandsworth.

TWIN Kerry, 5-6 h.p., Fitall gear, coach-built, did condition; £25, exchange motor boat.—F Gorhambury, Addlestone.

6 h.p. 2-Cyl. Tricar, Fafnir engine, wheel ste coach-built two speeds; £35, or exchange. Croydon Rd., Beckenham.

6½ h.p. Quadrant Carette, latest model, perfect condition; trial given to genuine buyer; £30.—9, Co St., New North Rd., N.E.

6 h.p. Twin Antoine, Chater-Lea, very fast, as perfect; £23; appointment by letter.—Motor Barrett, Parade, Brentwood.

REX Tricar, 6 h.p., twin, almost new, bucket back, Palmers, lamps, spares; any trial; £22 offer.—50, Crown St., Lowestoft.

TRICAR, 3½ h.p. Phoenix, thorough order; seen 27 immediate sale; going away.—J., 20, Pe Mews, South Kensington, London.

8 h.p. De Dion, like new, driven like car, perfect tyres, grand touring machine; take £50, cost double.—479, Green Lanes, Harringay.

3½ h.p. Humber Tricar, good order, fan-cooled engine, new Clincher A Won on back wheel 10s., cheap.—Oldfield, Stonewell, Lancaster.

ROVER Tricar, 4½ h.p., free engine, two speeds, cooled; £25, or exchange good motor cycle, moto preferred.—3a, Bridge St., Cambridge.

3½ h.p. Light Tricar, Kynoch engine, wicker car 32. Dunlops front, spare wheel, 50 amp. bat photo, trial; £12.—Radford, Motors, Stafford.

£25, or near offer.—Tricar, 7 h.p. Buchet, three-lamps, tools, spares, and insurance poli I.E.C., Holmlea, York Rd., Weybridge, Surrey.

8-10 h.p. Tricar, twin, water-cooled, two speeds, built, seats three, climb anything; £35; exc lower power and cash.—7, Albany St., Camberwell

ADDRESS—20, TUDOR STREET, LONDON, E.C.

A Review of the Scottish Trials.

Of the Scottish Trials of 1909 are not to rank as the most exacting trials ever held for motor bicycles in Great Britain, it can only be because the distance was less than that of an A.C.U. Trial, amounting approximately to 760 miles instead of 1,000. In all other respects Mr. B. H. Davies, who described the trials for *The Motor Cycle*, agrees with us that the trial was very considerably more arduous than any other motor cycle trial, for the following reasons:

(1) Amulree Hill is far worse than any hill the A.C.U. Trials have attempted. It is very long, very steep, includes the worst kind of double corner, and on July 19th a fearful gale was blowing straight down it.

(2) The time schedule was very severe. Competitors were required to average twenty miles per hour, with only ten minutes margin, early or late, over long control sections, e.g., in the Scottish Trials over a fifty-mile section maximum time was 2h. 40m., whereas in an A.C.U. Trial it would be 3h. 8m.—a difference of nearly half an hour. This was a stiff test of all low powered machines and of any high powered machine encountering any trouble whilst in this section.

(3) The weather was very trying for practically the whole of the trial. The roads were exceedingly bad, on the second day especially. No day passed without some rain, and when it was not wet and greasy, violent headwinds usually halved the horse-power of the machines.

(4) A good many of the 760 miles were over very rough surfaces. Thirty miles especially of the Betty-

hill to Lairg road were in such a condition that many motor cyclists would have called them unrideable.

As the above description makes plain, the Edinburgh M.C.C. frankly ran these trials on a novel principle. It argues that most important reliability trials are held with the desire of getting all the riders through on a level, provided they have no really serious or constant trouble. When the amateur reads the report of such a trial he finds that the bulk of the entrants have won gold medals, and though he knows that a handful of the machines are head and shoulders above the others, yet the report does not enable him to identify these machines. The Edinburgh M.C.C. resolved to make its trial so severe that it should really differentiate good from ordinary machines, and ordinary from inferior machines. Its award list shows that it succeeded, as only two machines came through with an absolutely clean sheet, and even those lower down the list are distinguished the one from the other by the number of marks lost. The motor cycling community will welcome a trial held on this plan, although we must admit it weighs heavily upon good machines which have a lot of tyre troubles; for example, down towards the bottom of the list will be found several good machines, ridden by good riders, whose penalties were incurred by serious tyre troubles.

In studying the results published last week it should be remembered that the riders were almost exclusively amateur, and included some really excellent sportsmen, also (low be it spoken) some of the biggest duffers.

Needless to say, the run will be repeated next year on very similar lines, and we have no doubt there will be a greatly increased entry. Amateurs will be attracted from England by the sporting nature of the

Scottish roads and the grandeur of the scenery; even in Wales and Devon there is nothing to equal the moorland scenery of some of the big "straths" up North and such panoramas as the view of Dornoch Firth from the shoulder of Altramain Hill. The English industry may also be spurred into supporting the event liberally. We are told that many a Scotch enthusiast hinted to Mr. Davies that the English firms dare not send their own men to ride in a Scotch trial with the machines they send up to Scotland for sale. This, of course, is arrant rubbish. Twenty-six English trade riders would have made a better show than the twenty-six riders who went through this year, and the majority would have scraped up Amulree

even at their first attempt. The English make abstained because they are rather overweighted w open competitions, and they did not know how t first experiment would materialise. But next ye they cannot afford to ignore a trial which knocks su simple rides as London-Edinburgh into a cocked h and is more exacting than the Shrewsbury Trial. T two or three English trade riders who travelled No for the trial acknowledged quite frankly that the fi three days were more trying than anything they b experienced on English soil. Personally, we shou like to see the A.C.U. hold another End-to-end n next year, and the Scottish Trial starting from W a few days later. We shall see.

OCCASIONAL COMMENTS.

By "IXION."

Compression Improvements.

I have just received an advance proof of the judges' report in the Scottish Trials, and I notice an improvement of vital importance, which was also emphasised in the A.C.U. Trials, viz., that the modern motor cycle engine can retain its compression for long periods. Experienced riders will remember how, after we had run a new machine for a few hundred miles, its compression had usually almost disappeared, and, in spite of all our efforts, it never again touched its primeval standard. To-day a first-class motor cycle engine will often support the rider for whole minutes on the pedal after it has been run several thousand miles, even though the exhaust valves have never been ground in this distance. Owners of obsolete engines should first make sure their pistons are a good fit; then, if modern rings, modern two-piece exhaust valves, and modern compression washers are fitted, the obsolete machine will often emulate the performances of a 1909 first-rater in this respect. The improvement is largely due to experiments and uniformity in castings. Piston rings, cylinders, and valves are also not only better made, but made of more suitable materials.

The Secondary Brake.

I was much amused by the futility of the average secondary brake fitted by many riders in the A.C.U. Trials in compliance with the regulations. We are all aware that in practice most riders rely exclusively on their belt rim shoe brake, which is more than sufficient for all purposes on a machine that is properly driven. If the secondary brake gives no trouble, and sets up no friction, the rider sometimes allows it to remain on the machine as a useless but law-complying excrescence; more often, perhaps, he contemptuously removes it altogether, knowing that it can never conceivably be of any real use, and that it always contains possibilities of trouble. I heard one trade rider in the Six Days' Trials cursing his secondary brake up and down; he was obliged by the rules to carry it, it was of no use whatever, and at the moment it was rubbing and causing friction, just before one of the big hill-climbs. "I put it on," he explained, "just before the trial, because I had to; and it will go quickly into the dustbin as soon as I get to Uxbridge." I don't suppose the A.C.U. could alter the law that compels us to carry two brakes, even if it were inclined to, which it isn't; and if it could, it

would be a bad thing, as sundry machines have chain drive, and so are debarred from using the best motor cycle brake there is. In the meantime I know from experience that even the belt rim brake can occasionally go amiss, and that it is good to have an emergency brake in reserve. The thing to do, therefore, is to provide a front wheel brake or a secondary rear wheel brake, which shall not be a mockery or a sham. I often wonder why motor cycle front wheel rim brakes

A tri-car belonging to J. L. Baird, of Helensburgh, at the hairpin bend of "Rest and be Thankful," between Arrochar and Inveraray. The gradient is about 1 in 4 at this point, and the surface is very bad, being full of ruts and covered with loose stones.

are usually so worthless. I have known reliable front wheel motor cycle brakes, i.e., brakes which did not give trouble, but which gave no trouble. On my pedal cycle I have a Bowden front wheel rim brake, which is full of power, and gives no trouble. It seems to me that careful design and manufacture could soon produce a front wheel motor cycle brake which would be really efficient. We want more leverage, shoes with better frictional qualities, and rims with a proper braking surface, not to mention accessible adjustments.

The A.C.U. Trials.

I must congratulate the A.C.U. on acquiring the courage to deliberately seek out some of the worst hills it could for its Thousand Miles Trial this year.

Casual Comments.—

This is the surest method imaginable of encouraging change-speed gears, and if a similar plan is adopted next year, very few will dare to compete without the aid of variable gears. At the same time the climbing in the trials was distinctly disappointing. I secreted myself on an insignificant hill, which I have not yet mentioned in any report (Holywell Hill, between Asaph and Chester), about threequarters of a mile, averaging perhaps 1 in 13. Among other items of interest noticed on this very ordinary ascent, I saw two two-speeded machines change down on to their over gear; I saw thirty or forty men pedal pretty hard; and I saw over a dozen men fail outright, some of them on duplicates of machines which win hill-climbs every month. The facts about the hill-climbing powers of motor cycles to-day are that almost any machine will climb almost any main road hill; that when an engine is either hot or badly carbed, it will fail on quite insignificant gradients; and that only the possession of an emergency gearing can enable the motor cyclist to climb every hill he comes to with ease and certainty.

Time Margins in the A.C.U. Trials.

In the big car trials each entrant is penalised a mark for every minute spent on adjustments during running time. The nature of things renders such stern treatment of motor cycles for ever impossible, simply because they cannot be continuously observed. Let me just notice, however, how very far our trials fall below the car standard. The average daily run is 180 miles. Riders lose no marks provided they cover this in an average speed of between sixteen and twenty miles an hour. At the lower speed the 180 miles occupy eleven and a quarter hours; at the higher speed nine hours. *Ergo*, each competitor has two and a quarter hours daily at his disposal for unpenalised repairs. In addition, he has an hour before starting, and, further, many of the competitors save much on minimum time over the more open routes

The winning team in the A.C.U. Six Days' Reliability Trials. The two-speed Phelon and Moore machines scored a well deserved and popular win, the riders being W. Milnes, R. Moore, and W. Pratt.

that they snatch an average of a further two hours daily. It is, therefore, possible for a rider on a fairly fast machine to spend about thirty hours on adjustments and repairs in the course of an A.C.U. six days' trial without losing a single mark. A competitor in the Scottish Car Trials who spent this period in repairs would lose 1,800 marks. Now I am not implying that the average competitor in the A.C.U. Trials actu-

The July camp at Carmarthen. Two motor cyclists attached to the 7th Batt. Welsh Regiment (Cyclists) who rendered excellent service.

ally utilises this spare time in tinkering. As a matter of fact, the majority of the riders spent it in chatting, smoking, refreshments, or cleaning their machines; and many a rider came through this year practically without touching his machine at all. But in all A.C.U. Trials a few men gain medals whose machines are not absolutely first-class; and, in justice to the men and machines who came through without trouble, I think the conditions ought to be made much more strenuous. To this end I should suggest an increase of the minimum speed to eighteen miles an hour (instead of sixteen) and the rigid observance of the rule about being ahead of minimum time. The Edinburgh rule would do excellently, viz., that half a dozen secret checks will be instituted during the trial, each half-way through a long section, and that any competitor caught fifteen minutes ahead of minimum time should be disqualified from receiving any award except a certificate. On this scheme only the riders who get through without trouble could win medals.

Adjustable Pulleys.

I wonder how many riders utilise adjustable pulleys on my plan. I now make it a rule to carry two belts, say a 1in. and a $\frac{3}{4}$ in. I use the pulley adjustment solely for taking up belt stretch or reducing the length of the belt after a pull through. When I come to an exceptional hill I slip off the inch belt and fit the narrower one, changing again at the top of the hill. I find this is on the whole less troublesome than using one belt and an adjustable fastener, and as the narrow belt is always clean it invariably takes me up bad hills without slipping, whereas if I lower the gear for the broad belt, which is often already rather greasy, the combination of gradient, greasy belt, and small pulley often produces slip on the worst knuckle of the hill. Owners of machines at present fitted with $\frac{7}{8}$ in. belts should not exceed this size in procuring a spare, or a certain amount of grip will be lost by the belt projecting above the flanges of the pulleys.

Motor Cycle Engines on Flying Machines.

ON the 25th ult. the whole country was ringing with the news that an aeroplane had been successfully flown across the Straits of Dover from France to England. M. Blériot is to be congratulated on being the first to cross the English Channel with the aid of a flying machine. Our reason for writing this short article and publishing a few illustrations is to draw readers' attention to the fact that

The three-cylinder V type Anzani engine (as used on Blériot's aeroplane) was first used in a small size, on motor bicycles, and appeared with great success in Continental speed events two years ago.

the motor cycle has had a good deal more to do with the perfecting of the aeroplane than a great many would suppose. First of all, the illustration on page 581 of M. Archdeacon's experimental motor cycle flying machine should be studied. As a real matter of fact this experimental machine, which was built by M. Anzani—the one-time champion motor cyclist—to M. Archdeacon's instructions, was an attempt on M. Ernest Archdeacon's part to solve the problem of the heavier than air type of flying machine, or, to be more correct, the machine was used to study the effect of the propeller at speed. It will be noticed that the propeller on this aero motocycle—which, by the way, accomplished a speed of 50 m.p.h. on the Achères Road in September of 1906—is fitted in front of the motor cycle, and in the same position as the propeller on the historic aeroplane called the "Monoplane Blériot XI," which carried its inventor from Calais to Dover last week. The same engine-maker who made the twin-cylinder engine illustrated on page 581, which was used to propel the aero motocycle, also made the engine used on the "Monoplane Blériot XI." It is a 25 h.p. air-cooled Anzani, with exhaust release ports, similar to the three-cylinder engines used on pacing motor cycles for the last two or three years. It will therefore be seen that the motor cycle has had a considerable part

to play in the perfecting of the successful monoplane. And this brings us to another illustration which was published in the Spring Number of *The Motor Cycle*. This was entitled "A Glimpse into the Future," and was the product of Mr. F. Gordon Crosby, whose drawings are more often seen in the pages of *The Autocar* than they are in *The Motor Cycle*. Accompanying the drawing was an article entitled "The Possibilities

the Motor Cycle Aeroplane," by "Motor cyclist," who said in the course of the article that, "as a humble student of the work of the flying pioneers, and also as an ardent motor cyclist, I have given considerable thought to the possibilities of a light, low-powered aeroplane. The kind of idea we all have in our minds is a motor bicycle with folding wings and a propeller." "Motor cyclist" was careful to say that, although fascinating, he was afraid the idea was far from realisation. However, "Blériot XI" seems to be a nearer approach to his idea than anything which has yet flown, and although far-fetched and even looked upon at the time by those who wrote and published it as far from realisation, there may be more in the idea than was expected. It is, of course, impossible to controvert the laws of nature, and experts on the subject tell us that certain details in the construction of these machines render folding

wings or planes hardly practicable. The idea of a motor cyclist starting along a road, getting up speed and then extending the machine's wings or plane, throwing over a clutch to disconnect the engine from the road wheel and start the propeller, is very difficult to attain, and not what is really needed to start an aeroplane. However, we have shown enough to prove that the motor cycle has had more than a supernumerary part to play in the production of Blériot's aeroplane.

This drawing entitled "A Glimpse into the Future," appeared in the last Spring Number of "The Motor Cycle," and the dream has been rendered much nearer realisation by M. Blériot's cross-Channel flight.

MotorCycle Engines on Flying Machines.—

Side by side with the perfecting of planes and their lifting power will come the development and improvement of the petrol engine until some day in the future it may be possible to attain the ideal put forth by "Motair-cyclist." Most of the earliest flying machines, and even many of those now being experimented with, are fitted with very much more powerful engines than the three-cylinder 25 h.p. Anzani engine. As the first flight across the Channel was accomplished with the aid of one of the smallest aeroplanes yet constructed, it is reasonable to suppose that in course of time weight and horse-power will be further reduced. Will it then be possible to attach a flying device to a motor cycle and use road wheels or planes and propeller at will? Time alone can show, but the idea is certainly not wildly impossible, as Channel flight itself was proved to be an impossibility not long since.

Patriotic Britons will doubtless experience a feeling of disappointment that the honour of first crossing the Channel has been lost to their country, but it is satisfactory to note that at least one British invention had to be requisitioned to enable M. Blériot to accomplish his feat. The Bowden wire mechanism, in fact, played a vital part in the control of "Blériot XI.," its flexibility and lightness rendering it peculiarly suitable.

Anzani (the maker of M. Blériot's engine) is here seen carrying out experiments in 1906 with an aero motorcycle on behalf of M. Archdeacon. A speed of 50 m.p.h. was attained with the machine shown.

THE NEW MOTO-REVE MAGNETO.

IN accordance with a suggestion made in *The Motor Cycle* a little time ago, the Moto-Rêve Company has altered and improved its magneto in detail, fixing the contact breaker externally, and thereby following the lines adopted by well-known magneto manufacturers. The accompanying illustration shows how this has been

A. Fibre cam. D. Steel roller. B. Rocking arm or bell crank.
C. Platinum screw on bell crank and lock nut. E. Spring holding cover and condenser connection. F. H.T. terminal.

carried out. By reference to it it will be seen that the fibre cam A attached to the bell crank B carrying the platinum screw C makes contact with the steel roller D, thus causing the points to separate. Both platinum points have been made adjustable, and the whole magneto has in general been made more accessible. If any fault existed on a Moto-Rêve it was the inaccessibility of the magneto contact breaker points, and champions of this most excellent little machine will welcome the improved type of magneto, as on a twin-cylinder machine it is even more important to keep the contact points in perfect order than it is on singles. The finish and workmanship are excellent, and leave nothing to be desired.

R. Goldberg (4 h.p. 1909 Twin N.S.U.), winner of the Johannesburg Motor Cycling Club's Hill-climb, Consumption Test, and Reliability Trial, which took place on June 27th and 28th. He obtained highest possible marks in each event, and was the only one of the twelve competitors to do so.

QUESTIONS AND REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor St., E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Coil Connections.

?

My motor cycle is a 1904 pattern Quadrant, and is at present fitted with a trembler coil, and I wish to try a plain coil instead. The one I have is a Nilmelior, with the usual four terminals—three at one end marked P, M, C, and one at the other end marked B. Will you please tell me how to connect wires?—T. H.

The coil should be connected up as follows: P = accumulator, M = frame, C = contact-breaker, B = sparking plug.

Licences. Paraffin as a Fuel.

?

(1.) What is the amount of the licence for a tricar, or a two-wheeled sidecar (such as the Lowen type)? (2.) Is there any workable method yet invented of using paraffin instead of petrol for motor cycles?—G. S.

(1.) The Inland Revenue licence for a tricar weighing under 3 cwt. is 15s.; for a two-wheeled sidecar, which with two wheels to the motor bicycle makes four wheels, £2 2s. Some county councils will register a two-wheeled sidecar as a trailer for 15s. (2.) From time to time there have been several paraffin carburettors on the market for motor cycles, but these have disappeared, as it has been found that paraffin causes excessive sooting of the engine and valves.

Contact Breakers and Speed. Wear of Bearings.

?

(1.) Kindly tell me if, when using a trembler coil, a greater speed is obtainable with make and break contact breaker or with a wipe contact. At present on my machine I have make and break, but thought of fitting wipe contact. Also on the former is it advisable to have the points far apart or close together? (2.) My engine has a knock, which is noticeable when wheeling it along, but, if driven with ordinary care, is never noticed while running, even on hills. Will you kindly say if it will do it any harm to run it for, say, a month or so before I rebush it?—W. H.

(1.) The highest speed and the best efficiency can be obtained from a non-trembler coil and make and break contact breaker. If you fit a wipe contact breaker you will lose in efficiency to an enormous extent, although starting may be rendered slightly easier. It is the best plan to have the points adjusted as lightly as possible in each case, as this saves the platinum from wear and pitting. If you adjust the contact

screw with the engine running on the stand you cannot get far wrong. (2.) The knock you refer to is most probably due to wear of the engine bearings, or you may be deceived by the clatter of the valves or the click of the cams. If there is a distinct knocking noise the bearings must be worn, but it is not absolutely necessary to have them rebushed at once.

Misfiring at High Speeds.

?

I have a 3½ h.p. Rex (accumulator) which is in perfect condition, and will carry me up every reasonable hill splendidly; in fact, it goes up hill better than on the flat. When going up an incline the engine works with perfectly even strokes, but as soon as I start going on flat or down hill and get up a good speed, the machine seems to be going too fast for the engine, as it were, and it misfires badly. I have to keep switching off, and then it starts all right again until speed gets up. The ignition is correct, and, as far as I know, everything is in perfect working order with the exception of the above.—S. N.

The trouble may be due to the carburettor, which does not admit enough

Campbell MacGregor, hon. sec. of the Edinburgh M.C.C. He competed in the Scottish Five Days' Reliability Trials from Edinburgh to John-o'-Groat's and back, gaining a silver medal with his 5 h.p. 1909 Matchless.

air at high speeds. Probably a larger choke tube would cure the trouble. Another likely cause of the misfiring is the mal-adjustment of the contact breaker points. Hints on how to adjust the contact points have many times been given in these columns, but we may remind you to adjust them

with the engine running on the stand and let them bear together as lightly as possible. If your machine has a trembler coil, this may also be incorrectly adjusted, and the above remarks will apply in this case.

Engine Refuses to Start.

?

I have a last year's 3½ h.p. motor bicycle, but cannot get it to work. I have had the plug out, and find it sparks all right, but the engine does not fire. I have also dismantled carburette (Amac, worked by levers on tank) but there is no stoppage, and petrol flows freely. What I do get is a very sharp "chug" or puff in the carburetter, sounding almost like an explosion in the silencer. I have tried it with air inlets open, also with extra air inlets closed, and with White's economiser fitted to reduce air supply, but all I get is the sharp puff in the carburetter. Can you tell me what is wrong?—B. J.

First of all, we should recommend you to check the timing of the spark and also of the valves, as it looks very much as if something had gone wrong in this part of the machine. Before you do this, however, it would be a well to notice whether the inlet valve opens and closes properly.

Attention to a Magneto.

My Bosch magneto has given perfect satisfaction for nearly 2,000 miles, but am I neglecting it by merely oiling it every 100 to 150 miles? I am careful to keep the contact-breaker cover clean, but wonder if I have better trim the contact points or have anything done to the magneto or can I leave it alone with confidence that it will work well for much longer mileage?—PEEPING TOM

So long as your machine starts easily, accelerates quickly, and attains a high speed, there cannot be anything wrong with the magneto, but it would be advisable to remove the contact-breaker cover and remove all the surplus oil and dirt with a rag or toothbrush soaked in petrol. If the contact points are quite black and pitted, trim them with a fine jeweller's file, or one of those sold for the purpose. The oil reservoirs should be swilled out with paraffin from time to time. There are screws underneath the reservoirs to allow the paraffin to drain away. It is also a good plan to remove the carbon brush occasionally, and rub the end of the pencil which bears on the slip ring with fine glass paper.

Licences.

How many carriage licences shall I require? Up to a few weeks ago I have had a tri-car, now I have purchased a motor bicycle, and am keeping them both. I intend to make use of both as the fancy takes me. Sometimes one and then the other. Shall I require another carriage licence?—H. L.

You will require a separate carriage licence for each of your machines. The price is 15s. each.

Care of Accumulators and Rubber Belts.

(1.) Will you kindly let me know the best way to empty and store accumulators? I want to put them away for about twelve months. (2.) Also should rubber and canvas belts be dressed with anything?—S. C.

We should recommend you to discharge the accumulator through a test plug, empty out the acid, and then fill the cells with plain water. (2.) Rubber belts require no dressing, but for long life they should be kept free from petrol or oil, and should always be fitted to run in one direction.

Speedometers.

I have been trying to get a speedometer from 0 to about 40 mm., hand travelling two-thirds round the face, maximum hand odometer and trip, but can hear of nothing such as I want except a Stewart car size, and this the makers refuse to adapt to 26in. wheels. Can you tell me of any likely to suit me? I have heard of the Klein speedometer, but cannot find any address of a factor or maker. Do you know it?—J.H.

The speedometer mentioned is the model, made under Klein's patent, obtainable from Messrs. Markt and Co., of 6, City Road, E.C. The same people sell the Jones, which would, I believe, do what you require. There is also the Cowey, which we have proved from practical experience to be a reliable article, but it has no trip order or maximum hand. It is made by the Cowey Eng. Co., 1, Albermarle Street, Piccadilly, W.

Cleaning Leather Belts.

I ride a Rex tri-car with belt transmission, two-speed gear and Roc clutch, and although I find the Watawata belt most efficient it sometimes commences to slip when roads are wet. This, I find, is caused by small particles of grit becoming imbedded in the leather. Can you suggest a remedy?—J.P., 1909.

The best plan is to procure one of the special belt cleaners called the Warren, which consists of a V-shaped metal plate lined with file card. The file card acts as a splendid cleaner, and if the plate is nailed or otherwise secured to a strong wooden handle, and the cleaner carefully applied to the underside of the top line of the belt while it is running on free engine the effect is magical. Be careful to see that the file card is so fitted to the handle that the nap of the file card runs the same way as the belt, otherwise the handle

may be jerked out of the operator's grasp. A good plan is to let the handle bear against a fixed portion of the frame. The belt should be dressed occasionally with Collan oil.

Measuring a Gradient.

Is there any simple means by which one can calculate the gradient of a hill? or can any simple instrument be attached to a motor cycle that would indicate it? Even an approximation would be most interesting, but one hears the wildest (at all events the most widely differing) estimates of hills in one's own locality.—CE 891.

The simplest way of calculating the gradient of a hill is to use a light plank of wood, a spirit level, a few bricks, and a foot rule. Get the plank level on the hill by means of the level, propping it up with bricks, measure the height of the extreme end and the distance, then you will easily calculate how many feet it rises one foot. We know of no reliable gradometer which can be fitted to a motor cycle.

Altering the Gear Ratio.

I have an old 2½ h.p. Humber motor bicycle, chain drive, 28in. wheels, and free engine. I have lowered frame, and am thinking of fitting 24in. or 26in. wheels. Would this alter gear? and what gear should you advise for this district (Doncaster), which is fairly flat? I weigh 12 stones. The number of teeth on wheels are as follows: On engine shaft 17, large chain wheel on bracket 46, small chain wheel (17 teeth), chain wheel on back hub 38. Please inform me what number of teeth would be most suitable on back hub for my weight with 24in. or 26in. wheels?—B.E.

If you fit smaller wheels to your motor bicycle you will lower the gear. If the engine is in good order and the compression good, a gear of 5½ to 1 should be quite low enough. At present it is

slightly lower than 6 to 1. By fitting 26in. wheels you would reduce the gear to 6.4 to 1. We should not advise you to fit smaller wheels than 26in. diameter on account of increased vibration and difficulty of obtaining such small tyres. If you find after fitting 26in. wheels that a 6.4 to 1 gear is too low—which is certain to be the case—you could fit a new sprocket on the engine-shaft with 18 teeth in place of the present one with 17 teeth..

READERS' REPLIES.**Engine Failures on Hills.**

In reply to "W.H.," whose 2½ h.p. inclined Minerva engine fails on hills. I used to own a similar engine which failed me on a certain hill under similar conditions to those mentioned by "W.H." I put the trouble down to overheating, till I ultimately discovered that it was due to lack of petrol. The frame of my machine being high, and the wheelbase short, it was impossible to reach down to flood the carburettor while running. I therefore had a tiny hole drilled in the top of the needle, and a thread from that point to the top bar of the frame enabled me to keep the carburettor on the flooding point, and thus easily surmount the portion of the hill which had previously seemed too steep for the engine. Let me add that I had every satisfaction from the engine in question, and now regret having parted with it.—Ex XS 4.

If "F.J.M." will send his full name and address and stamped envelope, a reply will be sent to his query.

The 1d. Edition of "The Autocar."

Readers of "The Motor Cycle" who are interested in motor cars are reminded that a Penny Edition of "The Autocar" is now obtainable of all Newsagents and Booksellers every Friday Morning, in addition to the 3d. issue.

Motor cyclists attached to the D Squadron of the Yorkshire Hussars Yeomanry—Stanley L. Gjerston (7-9 h.p. Bat) and John H. Dale (1909 Triumph), both active members of the Middlesbrough and District M.C.C. The camp is at Helmsley. The adjutant, Captain Walker, referred to the motor cyclists as the most useful men in camp.

A.C.U. Quarterly Trials.

THE third quarterly trials for motor cycles during 1909 held by the Auto Cycle Union took place on Wednesday last. The weather at the start was not promising, but for the most part it was good, the sun bursting forth at intervals. The course was the usual one, starting from the Chequers Hotel,

Eric S. Myers (Twin-cylinder Two-stroke Scott) who made a non-stop run.

Uxbridge, and continuing *via* Dashwood, Wheatley, and Islip, to Banbury, returning to Uxbridge *via* Bicester, Amersham, and Beaconsfield. The competitors were timed on Dashwood and Rectory Hills, Amersham, as in the past, but the times made are not officially communicated to the press; in fact, no competitor now receives any more marks for speeds in

excess of twenty miles an hour, but an average speed of sixteen miles an hour must be maintained on the timed ascents. The competitors were despatched from the Chequers Hotel, Uxbridge, at 9.30 a.m., and encountered a strong headwind all the way to Banbury. This was particularly noticeable on Dashwood, and greatly impeded the riders in their ascent of the somewhat formidable gradient.

Everybody was pleased to see A. G. Reynolds aboard again after his accident during the Six Days' Trial. He was busy at the start taking notes of the machines.

Lunch was partaken at Banbury, and the assembly of riders and machines made an imposing sight in the yard of the Red Lion Hotel.

On the return journey A. G. Fenn (6-7 h.p. B) retired owing to tyre trouble. He made a valiant attempt to complete the trial on a totally deflated tyre but found it impossible, and eventually, owing to the shock jarring spokes loose, the rear wheel collapsed and he was forced to abandon the trial. This was particularly bad luck, as Fenn was well in the running for the special cup. H. Berwick, jun. (3½ h.p. Excelsior), retired near Berkhamstead, owing to broken ball race on engine-shaft.

The following made non-stop runs, subject to official confirmation at the next committee meeting of the A.C.U.

- R. D. T. Wood (3½ h.p. Triumph).
- J. L. Norton (3½ h.p. Norton).
- A. Brown (3½ h.p. Midget Bicar).
- G. E. Stanley (3½ h.p. Premier).
- A. H. Haden (3½ h.p. New Comet).
- E. A. Colliver (3½ h.p. Triumph).
- F. C. Wood (4 h.p. N.S.U.).
- Douglas Steeves (2½ h.p. N.S.U.).
- A. T. Stanton (3½ h.p. Bradbury).
- W. Pratt (3½ h.p. Phelon-Moore).
- H. Bevir (3 h.p. L.M.C.).
- H. D. Teage (3¾ h.p. Premier).

The start from the Chequers Hotel, Uxbridge, last Wednesday morning.

Quarterly Trials.—

W. Walker (3½ h.p. Premier).
 Underhill (3½ h.p. L.M.C.)
 W. Bischoff (5-6 h.p. F.N.)
 Seyfried (3½ h.p. Triumph).
 Mc Myers (3½ h.p. Scott).
 W. Newsome (3½ h.p. Triumph).
 Marshall (3½ h.p. Triumph).
 G. Potts (3½ h.p. Triumph).
 Burr (6 h.p. Southey).
 Weller (5-6 h.p. A.C. tricar).
 Seymour (5-6 h.p. A.C. tricar).
 Portwine (5-6 h.p. A.C. tricar).
 C. Griersbach (3½ h.p. Triumph).
 Seven competitors made one stop.

W. Bischoff carried a passenger on the carrier of 5-6 h.p. four-cylinder F.N., as did also C. H. Rees on the Advance. The former completed trial without a stop, but the latter evidently suffered at least one stop, as his name is not among those making a non-stop run. R. G. Bell (4 h.p. T.T. U.) stopped on Rectory Hill; cause unknown. F. Applebee (5 h.p. Rex) suffered a sooted sparking near High Wycombe, and S. Kempson Jones (5 h.p. L.M.C.) stopped on Dashwood; belt slipping.

The judges were J. W. Brooker, H. G. Cove, and G. Reynolds.

W. Hewitt, jun., ascending Rectory Hill, Amersham, on his 3½ h.p. Excelsior

MILITARY MOTOR CYCLING.

A CIRCULAR letter was issued on Wednesday last from the War Office to all Territorial Force County Associations. The gist of the circular is that it has been determined to widen the scope of the existing Territorial organisations by the formation of a reserve which shall include all able-bodied men of suitable age who have shown themselves prepared to take part in the land defence of the country. The scheme, of course, embraces practically all classes, but the reserve force will consist of three classes, styled respectively the Territorial Force Reserve, the Technical Reserve, and the Veteran Reserve. The second is the one in which will be included both autocarists and motor cyclists. That portion of the circular which deals with the Technical Reserve reads as follows:

“The Technical Reserve will consist of individuals who, though they may have never served in any of the military forces of the Crown, would yet be able, in a time of national emergency, owing to special aptitudes, to render valuable service of an auxiliary character in connection with the national forces. For instance, members of the medical and veterinary professions, civil engineers, and especially electrical engineers, railway and telegraph *personnel*, the owners of motor cars, motor cycles, balloons, aeroplanes, etc., and many others can, if duly registered and organised for the purpose of national defence, render service of the greatest value.”

It appears that the organisations which control the pastimes under the head of the Technical Reserve will take a prominent position in the formation of the Force.

The three Auto-Carrier Tricars at the top of Dashwood. All made non-stop runs, which we believe establishes a record for passenger motor cycles.

THIRD QUARTERLY TRIALS.
 LONDON-LAND'S END AND BACK
 BROOKLANDS RACING

Fully Illustrated.

Police Traps.

Cromer-Holt road, about two miles out of Cromer; on the Cromer-Aylsham road, also near Cromer, and at Overstrand, on the Cromer-Mundesley road.

A Wise Decision.

As a result of the recent track disaster at Berlin, reported in our last issue, the German authorities have prohibited motor pacing of cycle racers for the time being.

Kindness Unrewarded.

The rider of a $3\frac{1}{2}$ h.p. N.S.U. who borrowed an accumulator at Whetstone on the 4th ult. is asked to return it to Mr. F. F. Smith, 80, Hewitt Avenue, Noel Park, Wood Green, without delay. The N.S.U. registration number is known. Mr. Smith's address was handed to the borrower together with the accumulator, and that is why he is unable to account for the delay in returning it.

A Fresh Speed Limit.

An inspector giving evidence in a police court case a few days ago at Bedworth, Warwickshire, where a motor cyclist was summoned for driving to the danger of the public in Bedworth Market Square, stated that it was his intention to summon every motorist who exceeded six miles an hour at that point. Motor cyclists should note this statement, as their only course in future appears to be to dismount and walk through the Market Square. Those who are acquainted with the town of Bedworth will not consider it a particular hardship to avoid the place altogether unless important business necessitates a visit.

Standard Machines in Competition.

The Coventry and Warwickshire M.C. has drawn up regulations for its open hill-climb on the 21st inst. which should settle the question of standard machines in competition. There are two classes—I. for full touring machines, II. for all other machines. A committee of scrutineers will examine every machine in Class I. both before and after the competition, and check over its specification with the regulations defining a full touring machine. Moreover, the cylinder will have to be removed if the scrutineers decide. This should encourage amateur riders to compete, for all will stand an equal chance (which cannot be said of most competitions in the past), and we congratulate the Coventry Club committee on their earnest endeavours to make the hill-climb of a really sporting nature.

A Reliability Trial in New South Wales.

The Motor Cycle Club of New South Wales held a reliability trial on June 7th, covering a distance of eighty-four miles, a considerable part of which was over mountainous country. There were thirteen competitors; an L.M.C. machine ridden by Roy Hughes securing the prize for the most meritorious performance.

Wake up, England!

In British military operations during the past two or three years, motor cyclists have rendered excellent work in despatch carrying from outlying troops, and many times the commanding officers have spoken in the highest terms of praise of the work performed by motor cycle despatch riders. Many foreign countries long ago recognised the utility of motor cycle despatch carriers, and have for some years employed squadrons of motor cyclists in military manoeuvres. At last it is announced that the War Office will accept the services of a "limited" number of motor cyclists at the cavalry manoeuvres near Oxford in September, but even at this late stage it is explained that the move is regarded as "purely experimental," as the authorities are anxious to test the usefulness of the motor cycle for military purposes. However, we have no doubt about the success of the experiment.

Quarterly Trials Notes.

P. W. Bischoff, who competed the Auto Cycle Union's third Quarterly Trial of 1909, on Wednesday carried an extra passenger seat, the luggage carrier of his four-cylinder F.N. Notwithstanding the weight, the F.N. succeeded in doing both Dashwood and Rectory Amersham, which is something test of hill-climbing.

The End-to-end Record.

As we hinted in the inscription under I. B. Hart-Davies's photo on page 574 last week, another attempt was made a few days ago to beat Land's End to John-o'-Groat's cycle record, but owing to a fall the ride came to an abrupt finish. The sixty miles had been covered. The rider was the rider who started on the attempt. This time he took good care to have his Rex machine and luggage sealed by *The Motor Cycle*, but was not with him, for he started pouring rain, and the treacherous face was the cause of the fall. However, he is not giving up altogether, and in a day or two will make another attempt, when we are to again see the pleasure of sealing his bicycle, which, we are told, is to be a standard pattern $3\frac{1}{4}$ h.p. single cylinder machine as used on his last

A.C.U. Quarterly Trials last Wednesday. Competitors halt at the top of Dashwood.

Club News.—

North West London M.C.C.

The date of the inter-club competition with the St. Albans and District M.C.C. has been altered to September 11th. This competition will consist of a 50-60 miles reliability team trial on the lines of the M.C.C. team trial for the Motor Cycle cup at Daventry, with a speed-judging and low riding contest added. If a suitable course can be found hill-climb will also be included.

Coventry and Warwickshire M.C.

With reference to the open hill-climb on the 21st inst., it has been decided to restrict the single-cylinder machines in Class I. (for full touring machines) to 500 c.c. and the twin-cylinder machines to 750 c.c., these being the limit sizes in the forthcoming Tourist Trophy Race. Higher-powered machines can be entered in Class II., which is for Tourist Trophy and special racing machines. The regulations and entry forms are now ready and can be obtained on application to Mr. W. F. Grew, 19, Hertford Street, Coventry.

Huddersfield and District A.C.C.

A reliability trial was held on the 25th ult. to North-Elerton and back, a distance of 116 miles. Owing to incessant rain only six started, but all got through. A. Liveredge (3½ h.p. Minerva) won the president's silver cup and club gold medal, and W. W. Gabbott (3½ h.p. Triumph) the club silver medal. Other competitors were R. Heaton (3½ h.p. Cat), J. P. Crosland (3½ h.p. Raleighette tricar), and L. Dyson (3½ h.p. Bradbury). The checking arrangements were in the hands of W. A. Lockwood.

Bristol Bicycle and M.C.

The above club carried out a penalty run on the 24th ult., the route being from Bristol to Cirencester and back, a distance of about seventy-two miles. The weather was not that could be desired. There were eleven entries, and the following made non-stop runs: Eli Clark (2¾ h.p. Douglas), T. R. Mereweather (2¾ h.p. Douglas), F. Bevan (½ h.p. two-speed Rex and sidecar), and E. J. Prosser (½ h.p. two-speed Phoenix Trim). All the competitors completed the journey very near to schedule time. The committee will make their awards shortly.

Bradford M.C.C.

The following competitions have been decided upon: August 9th.—A reliability competition, 150 miles, open to all members who have never won a gold medal for reliability. Route: Bradford, Harrogate, Ripley, Ripon (30m. top), Richmond (2h., dinner), Boroughbridge, Wetherby, Pool, finish White Cross, Menston. Medals, gold, silver, and bronze.

August 22nd.—150 miles passenger trials, open to any passenger vehicle. Trophy, the Phelon and Moore Cup. Medals, gold, silver, and bronze. Course: Shoulder of Mutton, Charlestown, Harrogate, Boroughbridge, Topcliffe, Leeming Bar, Boroughbridge, Wetherby, Harewood, finish Shoulder of Mutton. Speed, eighteen miles per hour.

Speed trials for three gold medals are arranged to be run in conjunction with the Leeds M.C.C. flying kilometre. The date will be announced later.

Surrey M.C.C.

On July 21st the above club held a reliability run to Arundel and back, and what would have otherwise been a good run was somewhat marred by a dog, which ran into a competitor's machine and caused a nasty fall. As several stopped to render this rider assistance and did not check their times the majority agreed to compete again. One competitor was driving an A.C. tricar, and the injured man was taken on board. Despite the somewhat hilly road, and extra weight, the tricar came in to time within half a minute.

Sutton Coldfield A.C.

Owing to unforeseen circumstances the hon. secretary of the above club has found it necessary to relinquish some part of his duties, as he finds it impossible to spare the necessary time required for both the general work and the organisation of competitions. The committee would therefore be glad if in future all matters relating to trials and competitions, etc., be sent to Howard Smith, the Dingle, Four Oaks, who has been elected to the position of trials hon. sec. The annual hill-climb will take place on August 14th (Saturday), at Coalport, near Ironbridge.

Essex M.C.

The next event of importance is the twenty-four hours' ride from Woodford to York and back on Friday and Saturday, August 27th and 28th. Entry forms and full particulars are about to be issued, and Mr. Harold Fuller, of Wynndale Road, Woodford, the hon. secretary, will be pleased to give intending competitors any information about the run. This was a very popular event last year, and a large entry is expected. A silver cup is offered, to be won outright by the rider adhering closest to schedule time throughout. In addition, gold medals will be awarded to all those who complete the journey in schedule time, and silver ones to those who complete the distance in twenty-four hours.

Lincolnshire M.C.C.

There was not quite such a good entry for the Palmer Cup Reliability Trial on July 24th as the members of the club had been led to expect, but there was a very interesting competition, which was quite successful. The start was at Wragby, a town about eleven miles from Lincoln, and the course, of a little over thirty-eight miles, was a circular one, through Horncastle and Louth, over the worst part of the Wolds, and had to be traversed three times. There was a gale blowing against the riders for two-thirds of the triangular course. A schedule time was set of 3m. 10s. per mile, with a slight margin either way, and secret checks were used. On one or two occasions competitors let themselves go, and this proved the undoing of several who had been riding very consistently. One of the worst hills was Cawkwell, which is very severe, having a gradient in one place of one in five and a half, but all the machines mounted well. R. S. Osborne (3½ h.p. Osborne, variable gear) got up very well, and managed to do second best performance, the winner being — James (4½ h.p. twin Minerva). Other competitors who rode well were — Turner (lightweight Lincoln Elk) and A. Nissler (four-cylinder F.N.). Mr. Rackham attended on behalf of Mr. E. J. Mitchell, the donor of the cup, and lent very valuable assistance in conducting the trial.

Competitors in the Twelve Hours' Reliability Trial, organised by the Middlesbrough and District M.C.C., for the Giers Cup and club medals. (See last week's Club News, page 569.)

The Future of Motor Cycling.

By B. H. DAVIES.

I HAVE come in for some keen criticism on account of my article on "The Motor Bicycle of the Future," printed in the Spring Number of *The Motor Cycle*. Various kind friends have called me insincere and dishonest for finding fault with the machines of to-day, which they see me riding far and wide in my own person with such evident gratification and convenience. Let me, therefore, explain why I cannot regard the machines of to-day as representing finality. For myself, I am more than satisfied with them on mechanical grounds. I find no difficulty in starting them, even uphill; I find the expense of running them is ridiculously microscopic; I find them thoroughly reliable; I find myself able to climb any hill on them with tolerable ease and certainty. Yet I regard them as very far from ideal.

The Riders of the Past.

Motor cycling is young as yet, and its appeal up to date has been made to a very limited class of men. An extremely large percentage of riders or interested nibblers are young, dashing, athletic, vigorous, and possess something of a mechanical bent. For ten years or so riders of this class have demonstrated the efficiency, the reliability, and the economy of motor bicycles to a somewhat incredulous public. The public is now becoming convinced.

Riders of the Present.

The bulk of the riders of to-day are still young, dashing, athletic, vigorous, and mechanically-minded. But amongst them there remains a strong leaven of us old stagers, who are growing into middle age, who have got wives and probably babies at home, who are beginning to push something of an embryo corporation in front of us, and who have lost a portion of our old dash and agility and daring. We now leave to others the thrilling dash round the bend of a fearsome hill, with the wall of the tyre where the tread should be, and the left or right ear tipped over sideways till it nearly fouls the bumps on the road. We are not quite so powerful at heaving a machine off its mark as we used to be, not quite so graceful in vaulting into the saddle as the impatient engine gathers impetus and way. We do not dive in between a couple of carts or two suspicious bullocks half-way up a steep hill with the old verve and aplomb. We are liable to streaks of lumbago across the small of the back after 200 miles in the saddle, to touches of cramp in the fingers and wrists after they have gripped a steel bar for a day and a night. We want machines even more docile than the present handle-lever-controlled tourist mounts; we want a less gymnastic mode of starting; we want the engine to start us up a grade, instead of our having to start it; we want to be able to potter up the long curly ascent when the roads are slimy, strewn with traffic, and so forth; we want absolute, not comparative, freedom from vibration; and we want a lot of other things we dare not ask for yet.

Riders of the Future.

Every year the ranks of the old crocks are reinforced by a host of business men who face their novitiate in middle age. Thousands of men are compelled to take many long and solitary journeys on either business or

pleasure, and they all hate the railroads. Railway travelling is dull, expensive, and unhealthy. Motor cycling is interesting, healthy, exhilarating, and cheap. Each succeeding year will see an increased influx of motor cycling novices who are neither brave nor strong nor young. They will feel the disabilities of the present standard ultra-efficient $3\frac{1}{2}$ h.p. tourist mount far more keenly than we old stagers, who welcome it so heartily as a vast improvement on the machines we have used in former years. If these middle-aged novices are to be kept true to the faith, if the influence of such riders is to be not only maintained but augmented, the motor cycle, in some of its forms at any rate, will have to be modified and improved to suit them. The young athlete will always be satisfied with the efficient $3\frac{1}{2}$ h.p. and 5 h.p. of 1909, if nothing better is offered him. But he is in a minority. If the sporting and industrial sides of motor cycling are to advance with equal strides, the great mass of middle-aged sobersides will have to be considered. An methinks the present state of three movements—the lightweight movement, the variable gear movement, and the two-stroke engine movement—are full of promise.

A good load. Mr. J. McDougal (hon. treasurer of the Hull A.C.C.) and family on their 6 h.p. Twin Sarclea and sidecar, fitted with Mabon clutch. The total weight of driver and passengers is thirty stones, yet the clutch is able to start the machine from rest on a fair gradient.

for the paterfamilias type of rider, and possibly even for the materfamilias type of rider. The clubs and the industry must form their own judgment. But a rider of some experience, who stands midway between the two parties in respect of age and physical vigour, I think the manufacturers of motor cycles will miss a great opportunity if they do not immediately concentrate themselves upon the interests of the more steady going riders and potential riders whom I have tried to describe. We don't all want to dash uphill at forty miles an hour; so long as we can climb all hills comfortably at a fair speed we shall be satisfied.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Chain Transmission

[4167.]—Among the interesting facts shown by the 1,000 miles trials was the wonderful condition at the finish, so far as the drive was concerned, of the machines fitted with chain transmission. Surely the time has come for the bulk of motor cycle manufacturers to abandon the unsatisfactory belt drive and fit a chain or shaft drive. If motor cycling is to remain popular recruits must come from the great pedal riding community and others wavering on the brink. The otherwise nearly perfect motor cycle will fail to attract large numbers until, like a car, it has an almost perfect transmission. Riders and possible converts await it.

WAITING.

Engine Speed and Vibration.

[4168.]—In reply to letter 4131 *re* above, my own experience is the exact antithesis, in that as the r.p.m. decrease the engine vibration appears to increase, and this on a modern machine. This also appears to be borne out by the following: I was recently afforded the opportunity of trying a high-powered single-cylinder racing machine, and found that to attempt to go at anything like slow speed resulted in the most abominable jerking and vibration at every pulsation of engine. Now I presume that if the machine had been geared considerably lower the vibration would have been greatly reduced, if not altogether eliminated, even at very slow speed.

ALEX. J. MCGAW.

Probably the compression was abnormally high also.—Ed.]

Lubrication.

[4169.]—In your issue of the 21st ult., under the heading "Notes on the Six Days' Trials," there is a paragraph in which Mr. A. T. Stanton's retirement is put down to the fact that he was supplied with "varnish" instead of lubricating oil, and the concoction he received was poured into his tank from a Vacuum tin.

We have at considerable expense adopted the system of sealing our cans and of calling public attention to the fact that when Vacuum oil is purchased in tins, the purchaser should take particular notice that the tin is sealed with a lead seal bearing our monogram and trade-mark, and on the side of the can we print in large type "Refuse this can if the seal is broken." There is therefore no excuse if motorists buy their oil in unsealed cans, and we strongly deprecate this practice.

There must, of course, be many thousands of our empty cans lying about in garages or elsewhere, and the probability that many of these cans are refilled with inferior oils.

We have prosecuted in some cases of this kind, and intend to continue to do so wherever we find anyone making fraudulent use of our packages, but if all motorists would destroy our cans when empty and refuse to buy an unsealed can, there would be no further trouble in this direction. The remedy is therefore with the motorist.

We hope you will consider this matter of sufficient public interest to give it publicity in your editorial columns.

VACUUM OIL CO., LTD.

Peck's End-to-end Record.

[4170.]—In reply to Mr. Edmund G. Burton on this topic, I am still awaiting the committee of enquiry upon my ride, suggested by Messrs. Brunton and Field, which will be heartily welcomed by me; but after they have verified my performance mile by mile they must publish in *The Motor Cycle* such verification.

For Mr. Burton's special edification, I will state once more that I rode one machine from start to finish, but whether he accepts my word and that of the committee, which I hope by this time has formed some shape, does not matter—I should advise him to closely examine the photographs of my start and my arrival.

T. PECK.

Heavyweight Riders.

[4171.]—I feel I must not be left out in the cold in this list, as I am one of the minority, weighing 18 stones 3 lbs. plus riding extras. My mount is and has been my very trusty Triumph 1906 pattern 3 h.p., and which now has carried me over 14,000 miles. Recently overhauled, it had up to May 31st cost me just 7s. 8d. for an up-to-date spring and bridge for the front forks. This is a fact, excepting, of course, tyres and belts. The former are the original Clincher with a Bates on the front and a Shamrock studded on the back. The inner tubes (Clincher) are also the original.

I have never had to walk home, never had a belt fastener "draw," and cannot speak too highly of the courtesy and splendid treatment received from the Triumph Co., in which I have no interest; neither am I connected with the trade.

WILSON PROSSER, F.C., Chairman W.D.M.C.

P.S.—Even my spares are as purchased. Original valve springs and plug still in use. The Stanley hook cannot be beaten.

Standard Machines in Competition.

[4172.]—As much ado has been made lately in regard to standard machine classification in hill-climbs with special reference to the Sutton Bank event, it is pleasing to note that the air has been cleared by this discussion, and at last we are favoured by a truly enjoyable and correctly classified sporting hill-climb.

With perfect weather and a wind blowing briskly up the course, the Bradford Motor Cycle Club open hill-climb up "The Steep," Denholme, was one of the best ever witnessed. It speaks volumes for the well-nigh perfect engines of the Rex and Triumph in the racing class that they should make exactly the same time up the hill, and that the tie was settled by another run up the hill with a difference of only a fraction of a second between them, the hill being three-quarters of a mile long and the steepest gradient 1 in 6.

A murmur of admiration arose when the Scott purred up the hill, perhaps not as fast as some others, but there are not a few of us who are content to ascend mountains in a matter of fact businesslike manner, which would be exceedingly difficult to classify in an open hill-climb, except, perhaps, under petrol consumption and silence.

H. W. TURNER.

[4173.]—In the letter published a week or two ago I notice Mr. W. E. Holmes says that the Rex Co. state that

their Speed King model "is not a touring mount." On referring to the Rex Co.'s letter [4114], I find that they say absolutely nothing of the sort.

As a matter of fact, I have just examined the Speed King Rex after its successful run through the Six Days' Trials. In my opinion it is one of the most beautiful little touring machines imaginable, being fitted with 2½ in. tyres, steel mudguards, a large Lycett saddle, and long handle-bars, giving a most comfortable touring position. Its weight is about 145 lbs., and this machine having come through the trials so well proves its ample strength.

Surely cutting down unnecessary weight is as important as getting the best out of an engine, and any attempt to reduce weight, as in the case of the Rex Speed King and the T.T. Triumph, is most praiseworthy, and should be given every encouragement.

With regard to Mr. Holmes's last paragraph, surely this is not intended to be taken seriously. Light machines (such as the Speed King Rex) have been used by several makers for some years, and their wins in hill-climbs have always been recognised. As the Rex Co. state in their letter, Sutton Bank was the first occasion upon which they entered a mount of reduced weight, and their wins are every bit as genuine as, for instance, those at Newnham last year.

W. A. JACOBS.

[4174.]—From letter 4145, Mr. Holmes seems to be of opinion that Godfrey's was the only machine that was not standard in the Sutton Bank hill-climb. He no doubt is unaware that any competitor could have protested before the hill-climb was over, and the fact that no one did so seems to point to the fact that others feared exposure, too. Anyhow, the Speed King passed the judges, and it is not in accordance with custom in most branches of sport for a prize to be returned after a final decision has been given. I do not ride a Rex myself, and have no interest at all in the firm, but I do object to the unsporting spirit which cannot admit defeat. It was the same thing after the 1907 Tourist Trophy Race, when champions of the second machine voiced their complaints against the winner.

Why should the winner alone be singled out for disqualification? He beat all the others, most of them at their own game. I presume Mr. Holmes wants Godfrey to resign his prize to Marshall, who was riding a type of machine not listed in the Triumph catalogue. The catalogue in my possession, at any rate, has details of everything in the standard machines, but not a trace of the T.T. model, and I think I am right in saying that not every T.T. is a counterpart of those sold to privileged amateurs. At any rate, improvements to be brought out in the future in these machines are "tested" not merely privately, but in competitions for standard machines. Even the 85 by 88 mm. engine is not kept secret until it is embodied in a standard machine.

FAIR PLAY.

Hill Climbing.

[4175.]—Having read an account in *The Motor Cycle* under the above heading of two change-speed geared machines climbing Bow Brickhill Hill, near Fenny Stratford, three members of the Northants M.C.C. rode there on their single-cylinder geared machines to attempt an ascent. C. T. Underwood made a clean ascent (first attempt) of both sides of this hill, after a practically non-stop run from Northampton (two minor stops being made). S. E. Temple and H. F. Andrews, who were less successful, kindly acted as marshals at the corner.

According to a Brickhill motor cyclist, this constitutes a record for single-cylinder, single-geared machines. The machine which climbed the hill was a standard "bought-over-the-counter" Triumph, with the exception of a protected device of the rider's own design, which takes the form of a variable carburetter jet which is shortly to be placed on the market. A brief description may interest readers.

No alteration is necessary. It is simply screwed into the carburetter in place of the single jet, and the operating lever projects a convenient distance to enable it to be moved while the machine is in motion. The device consists of two jet tubes side by side, the orifices of which are of different sizes—one large for big hills, and one small for level roads and ordinary hills. The movement of levers shuts the supply off one tube and opens the other at the same time. It is very simple, and there is nothing to get out of order. This device has been in use a considerable time, is very satis-

factory, and will probably meet the requirements of a number of motor cyclists.

I may add that the machine was fitted with a Grose steel studded back tyre, which I find very satisfactory, having had nine months' hard wear without a puncture. From the performance mentioned, readers will judge how little this tyre slows the machine, the gear used being 4½ to 1.

C. T. UNDERWOOD.

Controlling a Motor Bicycle from the Sidecar Seat.

[4176.]—I think the enclosed photograph will interest the lady readers of your excellent paper, especially those who like motor cycling, but who don't like riding the cycle made for ladies.

The photograph is of Miss Edith Lance driving a 6 h.p. N.S.U. from a rigid sidecar. The steering is extremely easy, and the great advantage it possesses is that it is im-

material what coloured dress the lady wears, as she is quite free from dirt in the sidecar, and there is no fear of skidding, whereas riding the cycle itself dirties a light coloured dress in wet weather, and the machine is liable to skid.

Of course, it is not necessary to have such a high-powered engine, but Miss Lance often takes a passenger, who of course has to sit on the saddle. Her brother also drives a similar cycle from the sidecar, and the pair are objects of much comment in Herefordshire.

L. P. MANNING.

A Dissertation on Design.

[4177.]—I was pleased to find Mr. Davies calling the attention of your readers to the necessity for the multiple jet carburetter. I mentioned it some time ago in your correspondence columns, but without exciting much response. "Ixion" advanced the time-worn argument that since the modern motor bicycle will run from six to forty miles per hour nothing further is required. But I think pilot jets are unsatisfactory and clumsy makeshifts, that cost more to adjust and keep in order than they are worth.

Another point I advocated was some means of varying the compression from the saddle, particularly desirable now that high compression engines are increasing in number. One would be able to run more slowly up hill and in traffic and it is well known that lowering the compression makes the engine quieter, which is what we want in crowded streets. The compression may easily be lowered by inserting extra or thicker washers beneath the valve caps. Perhaps some of our clever accessory makers could work out the idea.

"Ixion's" plea for spark control from the handle-bar is well worth attention. The modern high compression machine is very apt to knock on the slightest provocation. Curious enough I wrote recently to the Bowden people for the very fitment he mentions, but they could not supply it.

I cannot, however, support the writer in asking for gear transmission. Apparently, its one advantage would be to enable us to "mud plug" in comfort (is it possible to have any real comfort in such circumstances?) Now, I take it he writes for the mass of motor cyclists and not the faddist.

and I would ask what proportion do serious or continuous hard riding in winter such as cannot be managed fairly satisfactorily by fitting a larger belt? The motor cycle, like the open car, is a fair weather machine for most of us, and he would be just as profitably engaged in devising a Cape cart hood or other method of enabling the rider to face the elements. His anxiety reminds me of a similar state into which the enthusiastic photographer sometimes gets when he loads up his camera with cumbersome and costly devices with which he may go months and not find the necessity of using. Of course, special work requires special cameras, and there such devices become rational, and so with motor cycles. If I had to mud plug throughout the winter willy-nilly I should prefer to keep two machines rather than handicap one machine with a transmission that is not, in my opinion, suitable for general riding. Such a necessity does not face the vast majority of riders, however. Consider a few of the objections to gear transmission. Many readers will be able to add to the list: (a) All the stresses on the frame must be greater, necessitating greater weight (why should the De Luxe machine be a heavy monster?); (b) no simple gear changing unless further weight and complication; (c) difficulty of dismounting back wheel; (d) helplessness if a breakage occurs (not very infrequent); (e) noise; (f) high engine position, or else universal joint.

One other addition would be a luxury, viz., a clutch with pedal starting. Handle-starting is an abomination to all car drivers. Why have it on a motor cycle when starting from the saddle can be so easily arranged with the existing pedal gear? How often in a pretty district one stops the machine, with feet resting on the ground, to view the scenery? With handle starting, one must get off, fish out the handle, bend down and coffee grind, or else put up with the roar of a free-running engine. With pedal starting how much nicer! Similarly in stopping to ask questions, converse, etc. But a certain section preach that as handle starting is universal on cars it is the thing for motor bicycles; forgetting all the time the many efforts designers have made to abolish the handle for some method of starting from the seat.

A query. Could any reader tell me what he has found best in the goggle line? I hate riding continuously with goggles, but want something that can be put in position quickly with one hand when meeting or overtaking other traffic. H. M.

Sunday Competitions.

[4178.]—Let us examine "Anti-Humbug's" letter in the issue of July 21st, and your paragraph of June 16th. The A.C.U. has no rule prohibiting clubs or individuals holding competitions on the Sabbath, and the committee, in its wisdom, simply made a statement that it did not approve of Sunday competitions—that is all. This is exactly the position that the N.C.U. took up with push-cycles twenty years ago with respect to road racing. Of course, the N.C.U. never interfered with clubs, and road racing flourishes all over the country. (Take, for instance, the Bath Road Hundred this August Bank Holiday, with *eighty-five* entries!) There is no need for the A.C.U. to "speak right out and forbid them," as is suggested. The A.C.U. has done its duty, in so far as the public are concerned, in merely appealing to clubs to refrain.

THE WANDERING WORM.

Automatic v. Mechanical Inlet Valves. Two-stroke Engines. Silencers.

[4179.]—I intended sending a few notes regarding the letter from John Okill on "Automatic v. Mechanical Inlet Valves," appearing in a recent issue. From the description it is not clear as to whether he used different inlet springs for his tests of strength, or simply used the spring of the balance as an inlet spring. By looking at the illustration, it would appear that the latter was the case, and I would beg leave to point out that this being so the action must be unsatisfactory from two causes. First, the inertia of the moving parts of the spring balance would have the result of retarding the action of the valve; and, secondly, to increase the tension of a given spring by merely compressing or extending it is very bad practice. There is a certain proportion of working load to maximum which gives the best results with a spring, and to either under or over load it will impart its action. Then again, the proportion of the spring itself greatly modifies its action. For an inlet valve it is best to have as much wire in it as possible,

so that the tension of the spring shall not appreciably vary through the opening stroke of the valve. If the wire length be short then the spring may leave its seat readily enough, but as it opens the tension of the spring will increase so rapidly that the valve will not be able to give enough opening. The design of the valve itself, and its proportion also greatly affect the result. In most cases the valve is both too small and too heavy. Where both the inlet and exhaust valves are placed side by side it is impossible to have the inlet as large as it should be. Where automatic inlet valves are to be used the best place is in the head of the cylinder. Here they can be of ample size, while the exhaust valve can be removed without having to unship the inlet pipe. I have made engines with automatic inlet valves as large as eight inches diameter which showed no low line on the indicator card, and which also showed remarkably quick closing, thereby avoiding any blow back at the inlet pipe. All things being equal, there is nothing to be gained by the use of mechanical valves. The trouble is that there has been so much bad practice in the automatic valve.

I am much pleased to see that others are taking up the two-stroke engine advocacy, and I shall look with interest

A dusky rider of a Roc. This motor bicycle is the property of Mr. F. G. Haynes, of Fort Johnston, Nyasaland, and his boy servant rides it daily, and finds no difficulty in managing it; in fact, we should say that the tubular steel footrests have quite a comforting effect to the boy's bare feet.

for "Two-Stroke's" report on his two-stroke cycle engine. I also have several two-stroke motor engines designed, but am placed so as not to be able to prosecute them just yet.

"T.H.C." [letter 4076] is wrong in supposing that the small outlet holes in the silencer must be *greater* in total area than the area of the exhaust pipe, for this reason: it must be remembered that the exhaust, in the case of a single cylinder, only takes place during about a stroke, whereas there are four strokes time in which the exhaust can escape from the body of the silencer. The great thing is to have the chamber into which the exhaust first enters the silencer from the engine large enough, so that, supposing there was no outlet, the pressure would not be above, say, two pounds on the inch. The ideal silencer should have a chamber of unlimited size for the exhaust to expand into, but this cannot be in practice.

INCANDESCENT.

SUMMARY OF OTHER CORRESPONDENCE.

Will J. M. Pooley kindly note that he omitted his full postal address from the letter sent for publication? On receipt of these particulars the letter shall have attention.

EXPERIENCES WANTED.

"AW 354" would like to know if there is a revenue tax on motor cycles in South Africa, and the cost of petrol per gallon.

RECENT PATENTS.

By ERIC W. WALFORD, F.C.I.P.A.

A Trailing Carriage.

The trailing carriage A has secured to its axle B a tubular framework C. A complementary framework D is secured to the frame of the machine by clamps E, stays F running from an intermediate point to the saddle-pillar clip G. The

frames C and D are pivoted together at H to allow for the necessary turning movement.—A. E. Abrahamson, No. 6,321, 1908.

A Lady's Motor Bicycle.

A motor bicycle suitable for use by ladies is produced by

disposing the parts as shown in the drawings. The smaller figure shows the machine with protecting shields A in place. A feature lies in the pipe B, by which the exhaust gases, after passing through the silencer C, are conducted to the rear of the machine before being discharged.—A. and A. Dufaux et Cie., No. 26,254, 1908.

A Spring Mounting for Wheels.

Secured to each rigid fork end A is a tubular casing B within which is adapted to slide a tube C, having a lug D, to which is attached one end of the wheel spindle E. The

tube C is closed at each end by a cap F, and into it projects a spindle G, fixed to the casing B, and around which is arranged a coil spring H, which, together with a second spring J, absorbs the vibration. Between the tube C and casing B is arranged a cradle or cage carrying anti-friction balls at regular intervals, and the casing B is, of course, slotted to permit of the sliding up and down of the lug D and tube C under vibration. This springing device can be readily attached to existing machines, but renders a front rim brake inoperative. It would, however, be suitable for a front band brake if the band was attached to lug D.—F. C. Southard, No. 27,322, 1908.

Handle-bar Control Mechanism.

The object of this invention is to provide a handle-bar for use with Bowden control mechanism in which the cables are enclosed within the bar and are not subjected to sharp bends. A lug A is provided with suitable cavities to receive the handle-bar stem B and the two parts C and D of the bar itself. The parts C and D have only gentle curves, and at their ends carry ordinary inverted lever mechanism E and F. Further Bowden control devices G and H are attached to the bars at convenient points, and the cables after passing through the bars issue through the lug A. Lamp brackets J and K are carried by the lug A and secured by nuts at their lower ends.—A. Sharp and C. Williams, No. 6,643, 1908.

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

THE UNSOLICITED OPINION OF AN EXPERT.

"IXION," the well-known contributor to "THE MOTOR CYCLE," writes:

BOWDEN LICENSE.

"IXION" would be much obliged if Messrs. Brown and Barlow would quote for a set of spare jets for their standard motor cycle carburetter. The ones he requires are Nos. 30-34.

He would like to take the opportunity of congratulating Messrs. Brown and Barlow on the excellence of their latest carburetter. He has tried two others on his present twin-cylinder machine, and has discarded them both in favour of a B. & B., which he finds gives a higher maximum output of h.p., far greater delicacy of gradation in control, and more economy of fuel."

B. & B. CARBURETTERS CAN BE OBTAINED FROM:

- Messrs. BROWN BROS., London.
- " EAST LONDON RUBBER CO., London, Sheffield, and Bristol.
- " CHATER LEA, Ltd., London.
- " HOBDAY BROTHERS, London.
- " THE SERVICE CO., Ltd., London.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—9d. per line of 8 words; minimum, 3 lines. Name and address must be counted.

Two lines (16 words or less) costs 1/6
Three lines (24 words or less) costs 2/3
Four lines (32 words or less) costs 3/-

In the case of Trade Advertisements a series of ten insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. Ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Thursday morning, or if sent by London (20, Tudor Street, E.C.), by the Wednesday afternoon previous to the date of publication.

All letters relating to advertisements should be distinctly under what heading and in what column the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into divisions, as many readers like to know what machines are for sale in their immediate neighbourhood before going to see them.

In showing division of England into Sections.

SECTION I.
Northumberland, Cumberland, Durham, and Westmoreland.

SECTION II.
York and Lancashire.

SECTION III.
Carnarvon, Denbigh, Flint, Cheshire, Derby, Stafford, Shropshire, Montgomery, and Merioneth.

SECTION IV.
Leeds, Bradford, Halifax, Lincoln, Leicester, Rutland, Northampton, and Warwick.

SECTION V.
Essex, Suffolk, Cambridge, Huntingdon, and Bedford.

SECTION VI.
Gloucester, Hereford, Radnor, Brecknock, Monmouth, Glamorgan, Carmarthen, Cardigan, and Pembroke.

SECTION VII.
Gloucester, Oxford, Buckingham, Berks, Wilts and Hants, and Channel Islands.

SECTION VIII.
Essex, Middlesex, Surrey, Kent, and Sussex.

SECTION IX.
Devon, Dorset, and Cornwall.

SECTION X.
Ireland.

SECTION XI.
Ireland and Isle of Man.

MR. HART DAVIES

used our

FAMOUS . . . SEARCHLIGHT

when so handsomely breaking
the

John-o'-Groat's Record.

He chose the **BEST LAMP**—full of **EFFICIENCY** and devoid of **FADS**.

It was not a special lamp—in fact we did not know what lamp Mr. Hart Davies was using until after Record was beaten.

A NEW MODEL

REX

ALL OUR GOODS ARE SENT ON APPROVAL.

Premier Motor Co. Ltd.,

Aston Road, BIRMINGHAM

Telephone 4310.

Telegrams: "Primus, B'ham."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be provided for forwarding replies. Only the number will appear on the advertisement. Replies should be addressed, "The Motor Cycle, Coventry"; or if "London" is added to the address, then to the number given, "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown parties may deal in perfect safety by availing themselves of the Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, upon intimation of the arrival and acceptance of goods, the money is forwarded less a charge of 1s. registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. Deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Illife & Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive answers to their enquiries are requested to regard silence as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to one by post.

The World's Desire

(With apologies to Messrs. Andrew Lang
and Rider Haggard).

The NEW 3½ h.p.

BRADBURY,
£46.

Oh! the hour is nigh,
And the morn is bright,
When my MOTOR shall fly
Like the arrow's flight.
Let the shrill bird's cry
Waken them that sleep;
Heigh, oh! for a ride
On my BRADBURY sweet.

If you are interested we shall be pleased
to mail you the BRADBURY Motor
Booklet, giving useful hints as to driving
and describing the Best British-built
Motor Cycle, and send you name of our
nearest Agent.

BRADBURY & Co. LTD.
OLDHAM.
AWARDED 18 GOLD MEDALS.

ENGINES.

ENGINES for Cycles, cars, boats, and aeroplanes.—
Send for particulars to Advance Motor Mfg. Co.,
Ltd., Northampton.

IGNITION APPLIANCES.

TREMBLERS, for all makes of engines, with solid
pure platinum tips, 1s. 3d. each.—Meredith,
G.O.M., Birmingham.

IT is a fact.—Pure platinum is best for contact tips.
—Meredith G.O.M., Summer Lane, Birmingham.

DREADNOUGHT Contacts, cure misfiring; fitted
2s. 6d. each.—Fellows, 49, Hertford St., Mayfair.

GUENET Coil, single trembler, second-hand; cost
50s., a bargain, 15s.—Marrass, 53, Freehold St.,
Hull.

4 Volt. 20 amp. Celluloid Accumulator, new; cost 20s.
accept 9s. 6d.; approval.—Lane, 175, High Hol-
born, W.C.

VOLTOO Coils, Midget, 13s. 6d.; ordinary, 18s. 6d.;
high speed trembler, 25s.; all new.—Ajax Electric
Co., Ilford, E.

UNUSED 40 Amp. 4 volt. Accumulator, celluloid;
cost 30s., take 15s. 6d.; approval.—Perry, 21,
Baronsfield Rd., St. Margarets, Middlesex.

JEBRON, Registered 291-289, vastly superior to
platinum, cures misfiring; best contacts for blades,
screws, rockers, magnetos, coils. Jebzon has no equal.

JEBRON, 2s. 6d. each rivet fitted; Jebzon trimmers,
9d.; Jebzon screws fit Bosch magnetos DA2, DAV,
contact breakers 5a, 5b, 5c, 5s. 6d. pair; old screws Jeb-
zonised, 2s. 6d. each. Over 10,000 fitted. Try it.

JEBRON, King of Contacts, fitted return post free.—
From the inventor, J. Edwards Brown, 38, Her-
bert Rd., Plumstead, Kent. Liberal trade terms.

JEBRON Contacts were used by Messrs. H. A. Collier
(24 hours), C. R. Collier, H. V. Colver, Harry
Martin, when making their recent world's records.

IRIDIUM Champion Contacts.—Any parts fitted re-
turned same day, 1s. 3d. each, warranted pure;
special iridium trimmers, 9d.; magneto screws refitted,
1s. 3d. each.—Williams, 16, Wellington St., Woolwich.

MOTOR Ignition Repairs.—Coils, accumulators, mag-
netos repaired by skilled workmen; quotations and
lists free.—The Victoria Garage and Electrical Co., Ltd.,
Coventry.

R.O.M. Synchronised and Ideal contact breakers,
strongly recommended by "The Motor Cycle."
Catalogue free.—Continental Motor Co., 32, Rosebery
Av., London, E.C.

MAGNETOS.—Any make repaired on the premises by
skilled workmen; magnetos re-magnetised quickly;
work guaranteed.—The Victoria Garage and Electrical
Co., Ltd., Park Side, Coventry.

MAGNETO Repairs.—Send your Bosch magneto for
repairs to the makers only; report and estimate
submitted; repaired machines guaranteed equal to new.
—The Bosch Magneto Co., Ltd., 23, Store St., London,
W.C.

ACCUMULATORS, Magnetos, and Coils repaired,
lowest prices; work guaranteed; estimates given;
repairs executed in two days; Mayfair accumulators,
15s., 10s. 6d.; 20a, 15s.; guaranteed one year; second-
hand accumulators, from 4s.—Fellows, 49, Hertford St.,
Mayfair.

TYRES.

TWO Dunlop Wired Covers, 26 by 2½; 5s. 6d. each.—
Clover Cottage, Shakespere Drive, Westcliff.

TYRES.—A quantity of good second-hand motor cycle
and car tyres, any size, from 4s.—Jones, Albion Saw
Mills, Downs Place, Hammersmith.

COVERS.—Pair brand new 810 by 90 covers, 60s.
each; also two 870 by 90 ditto, 50s. each; cost
double, never used.—28, Woodbridge Rd., Ipswich.

26 Dozen Clincher Covers, all sizes, 17s. 6d.; rubber
studded, 25s. each; Clincher tubes, all sizes, with
valves, 5s. 6d., post free.—Farrar, Square Rd., Halifax.

CLINCHER Tubes, all sizes, 4s. 11d. each; Clincher
A Won covers, all sizes, 17s. 6d. We have just
bought threequarters of a ton of brand new perfect motor
cycle covers; any size per return; approval against cash.
—Halifax Motor Exchange, Westgate, Halifax.

NON-SKID Bands of all makes from 11s., including
vulcanising to your own cover; re-treading from
15s.; repairs according to extent; new illustrated cata-
logue of non-skid bands, re-treading, etc., sent free.—
Continental Motor Co., 32, Rosebery Av., E.C. Phone,
Holborn, 1513. T.A.: Bromitch, London.

REPAIRERS.

ACER, Ltd., for repairs.—64, Grosvenor Rd., Hanwell
W. Tel.: 438, P.O., Ealing.

COMPRESSION Restored, cylinder ground to .001in.
guaranteed; pistons fitted.—Acer, Ltd.

ACCUMULATOR SPECIALISTS

(Dept. M),

153, Fleet Street, LONDON, E.C.

REPAIRERS.

OXY-ACETYLENE Welding.—Broken cyls., lugs, flanges, water jackets, broken gear wheels; general castings repaired.

OXY-ACETYLENE Welding. — Aluminium, copper, etc., specialties.

OXY-ACETYLENE Welding.—Repairs guaranteed and returned promptly.

OXY-ACETYLENE Welding, also cyls. rebored, new pistons and rings fitted, rebushing, motor, gas engine, and general repairs and alterations of all descriptions.—Address enquiries to West London Welding Co., Essex Place, Chiswick. Tel.: 536, Chiswick.

CRACKED Water Jackets of Motors successfully repaired by Lea's metallurgical process. — Lea and Son, Engineers, Runcorn.

REPAIRS of every description promptly executed at reasonable prices; quotations given; workmanship guaranteed; adjustable pulleys, no tools required, 12s. 6d.—Broughton, Waterloo Rd., Hunslet, Leeds.

TO West of England Motorists.—Car and motor cycle repairs, prompt and reliable; cylinders re-bored, new pistons and rings fitted; don't hesitate; send straight to us.—Hamlin, Motor Wks., Bridgwater.

BIRMINGHAM.—Overhauling, cylinders re-bored, rebushing; pulleys, valves, any make; accumulators charged and repaired; frames cut down; ideas carried out; prompt attention.—Priest and Co., Bishop St.

CCCCCCCC.—Compression means power; cyl. re-bored and new piston fitted; guaranteed fit 4-1,000in., bears 13 stone on pedal; write for list.—Gradior Machine Co., Compression Specialists, Stafford.

BIRMINGHAM Motor Cyclists.—All repairs cheaply and intelligently carried out under personal supervision. We are compression specialists; cyls. rebored, and new pistons fitted from 12s. 6d.—Tennant Engineering Co., 53, Tennant St., Birmingham.

EXCHANGE.

BARLOCK Typewriter, for motor cycle, any condition: stamp.—68, Murray Rd., South Ealing.

MAJA Typewriter, nearly new, for motor cycle; stamp.—68, Murray Rd., South Ealing.

GIVE gramophone and little cash for motor cycle; stamp.—68, Murray Rd., South Ealing.

GIVE nearly new motor cycle for small car, one out of order not objected to; stamp.—68, Murray Rd., South Ealing.

GIVE Talking Parrot, speaks Hindustan and English, mimics and poetry, value £30, for tricar, or motor cycle, or small car.—Frank Edwards, 68, Murray Rd., South Ealing.

GIVE Motor Cycle, nearly new, for small car.—Frank Edwards, 68, Murray Rd., South Ealing.

LADY-BACK Motor Tandem, for magneto, single.—H., 5, St. Mary's Sq., Ealing.

5 h.p. Vindec Special, for tricar, or lightweight motor cycle.—Smith, 6, Church St., Cirencester.

EXCHANGE Brand new gent's green enamelled cycle, £8 8s., for modern sidecar.—Millard, Chesterfield.

CONTINENTAL Cover, new, 26 by 2, for trembler coil and accumulator.—2, Albert Hill, Bishop Auckland.

EXCHANGE new Chater-Lea Plain Coil for spring forks, 2 Whittle or Stratex.—Bott, 291, High Rd., Ilford.

2 3 h.p. Engine, M.O.V., B.S.A. make; sell, or exchange for sidecar, 28in. wheel.—Davies; Richmond Rd., Stechford.

4 1 h.p. F.N., 4-cyl., magneto, late 1908—exchange twin magneto, or sell £28.—Ben Hur, 69, Greenside Rd., Croydon.

EXCHANGE motor car, 4-seater, 6 h.p. Aster, for good motor cycle, or an aeroplane.—Rowland Cole, Cradley Heath.

EXCHANGE 6 h.p. Aster tricar, excellent condition, wheel steering; or sell £25.—2,891, The Motor Cycle Offices, Coventry.

BRAND New Gent's Bike and little cash for genuine 2 h.p. Minerva or De Dion engine.—6, Milton Rd., South Wimbledon.

LADY'S and Gent's Standard Triumphs (push bikes), unused, for a good motor cycle.—Godfree, 124, Romford Rd., Stratford.

SMALL 4-seater M.M.C., guaranteed, for twin cycle and sidecar: photos, particulars.—Morgan, photographer, Eastbourne.

4 h.p. Antoine, with Phelon and Moore two-speed gear, Palmer cord and Clincher A Won tyres, in excellent order; £14.—Heap, below.

3 h.p. Clyde, handy machine; £10.—Heap, below.

MONTGOMERY Sidecar, £4; Millford trailer, £2.—Heap, below.

CHATER-LEA Pacing Tandem Cycle.—Heap, below.

USEFUL Lathe: would accept good S.S. lathe in exchange for any of above.—Heap, Grove Garage, Ilkley, Yorkshire.

EXCHANGE excellent 3 h.p. twin Peugeot for up-to-date lightweight; full particulars; mutual approval.—A. Haward, Eldon Lodge, Hewlet Rd., Cheltenham.

OUR FAMOUS SEARCHLIGHT

and the GROAT'S RECORD

OUR TELEGRAM TO MR. IVAN B. HART-D

"Did you use our Searchlight breaking Groat's Record?"

THE REPLY—

"Yes, your lamp burned grandly, flickered all night. Hart-D

Later Mr. Hart-Davies kindly v

"Thanks for your wire with
ence to my recent End to End
ride. I have no objection to y
vertising the same if you wish to
since the lamp in question is t
which I have had in daily use

last year and a half. This lan
bought and paid for in the ordina
of business before I had any
going in for the Record.

It may interest you to kno
the only two lamps which did r
before our start of blinding c
country lanes from Wigan to T
bury, were Dr. O' Rafferty's
my own.

Times and times over, the lon
of light saved us on the nu
corners; and as there were five
riding in single file, it was highly
ant to have good lamps.

I have no objection to gi
testimonial where credit is due, a
I think you fully deserve.

Yours faithfully, J. B. Hart-D

DR. O'
RAFFERTY'S

MANCHESTER—235, Deansgate.
GLASGOW—128, Renfield Street.

The Brooklands Meeting.

WHAT were described as the July and August meetings were commenced on Saturday last. Three motor cycle and five car events were on the card for Saturday, and some good sport was witnessed, although it still appears difficult for the handicapper to bring the riders together in a bunch at the finish. A strong wind was blowing under the members' bridge and along the railway straight and against the riders. This caused the highly geared machines to labour somewhat, and may possibly account for some degree for the one or two easy wins. The motor car racing will be described in *The Autocar* of Saturday next. The first race was very well contested, previous performances had been very accurately judged by F. Straight, the handicapper, although Lee-Evans's wins in the other two races were rather a surprise. A remarkable feature was the fact that the August and Senior Motor Cycle Handicaps were both won by Lee-Evans and the Indian at a speed of about 60½ miles per hour, which is really remarkable considering the difference in the distances and the handicap allowance. The machine was the one used in the Six Days' Trials, with a new piston in place of the one which seized on the last day.

The Junior Motor Cycle Handicap.

The entrant of the winner to receive 7 sovs., or a cup at option; the entrant of the second 3 sovs., or a cup at option; and the entrant of the third 2 sovs., or a cup at option. Distance, about 5½ miles.

For motor bicycles, the cubic capacity of whose engines does not exceed 500 cubic centimetres.

Position.	Rider.	Machine.	No. of cylinders.	Cubic capacity.	Start.
1.	L. C. Munro (N.S.U.)	...	2	499	65s.
2.	W. W. Genn (Eland)	...	1	340	80s.
3.	J. C. Smyth (Rex)	...	1	449	40s.
4.	W. O. Bentley (Rex)	...	1	449	35s.
5.	A. R. Abbott, jun. (Triumph)	...	1	476	45s.
6.	W. H. Bashall (Zenith)	...	1	482	48s.

The following also ran: J. T. Bashall (W.H.B.), F. A. McNab (Trump-J.A.P.), D. F. Steeves (N.S.U.), E. C. W. FitzHerbert (4-cyl. F.N.), O. C. Godfrey (Rex), P. W. Bischoff (4-cyl. F.N.), A. G. Fenn (Triumph), S. F. Garret (N.L.G.), W. Dewar (Triumph), W. Pollard (Quadrant), and A. F. Rowell (M. and M.).

The winner's speed was 50 m.p.h.

This was a close race between Munro and Genn, 300 yards separated second and third, then three riders finished close together, with the remainder far in the rear. The winner's machine had Bosch magneto ignition, Shamrock-Gloria belt and Continental tyres, 26in. x 2¼in.

L. C. Munro (4 h.p. N.S.U.), who accounted for the first race at Brooklands on Saturday—the Junior Motor Cycle Handicap. Speed 50 miles per hour.

G. Lee Evans (5 h.p. Indian), who had a field day at Brooklands last week end, winning five events. It will be noticed that mudguards are fitted.

The August Motor Cycle Handicap.

The entrant of the winner to receive 7 sovs., or a cup at option; the entrant of the second 3 sovs., or a cup at option; and the entrant of the third 2 sovs., or a cup at option. Distance, about 5½ miles.

For motor bicycles, the cubic capacity of whose engines exceeds 350 cubic centimetres, but does not exceed 750 cubic centimetres.

Position.	Rider.	Machine.	No. of cylinders.	Cubic capacity.	Start.
1.	G. Lee-Evans (Indian) ...	2	...	638	... scratch
2.	A. R. Abbott, jun. (Triumph) ...	1	...	476	... 45s.
3.	J. C. Smyth (Rex) ...	1	...	449	... 40s.
4.	C. E. Bennett (Indian) ...	2	...	616	... scratch
5.	W. H. Bashall (Zenith)...	1	...	482	... 48s.
6.	L. C. Munro (N.S.U.) ...	2	...	743	... 20s.

The following also ran: W. Dewar (Triumph), J. T. Bashall (W.H.B.), F. A. McNab (Trump-J.A.P.), A. G. Fenn (Triumph), A. P. Applebee (Rex), D. F. Steeves (N.S.U.), E. C. W. FitzHerbert (F.N.), O. C. Godfrey (Rex), S. F. Garrett (N.L.G.), and P. W. Bischoff (F.N.)

The winner's speed was 60½ m.p.h.

The critics declared before the race that Lee-Evans was a sure winner, and so it proved, for man and machine were irresistible. Lee-Evans used a gear ratio of 3½ to 1, Bosch magneto, and R.O.M. tyres 28in. x 2in.

The leather helmet which is wisely worn by a number of Brooklands riders. It has proved worth its weight in gold to more than one racing motor cyclist.

The Senior Motor Cycle Handicap.

The entrant of the winner to receive 7 sovs., or a cup at option; the entrant of the second 3 sovs., or a cup at option; and the entrant of the third two sovs., or a cup at option. Distance, about 8½ miles.

For motor bicycles, the cubic capacity of whose engines exceeds 500 cubic centimetres, but does not exceed 1,000 cubic centimetres.

Cubic centimetres.			No. of	Cubic	
Position.	Rider.	Machine.	cylinders.	capacity.	Start.
1.	G. Lee Evans (Indian) ...	2	...	638	... 65s.
2.	H. G. Partridge (N.S.U.)	2	...	796	... 80s.
3.	H. V. Colver (Matchless)	2	...	964	... 25s.
4.	L. C. Munro (N.S.U.)...	2	...	743	... 90s.
5.	F. A. Applebee (Rex) ...	2	...	726	... 100s.
6.	F. Toman (Laurin-Klement)	...	2	...	905 ... 60s.

The following also ran: C. R. Collier (Matchless), W. E. Cook (N.L.G.), H. E. Parker (N.L.G.), H. Martin (N.S.U.), W. H. Bashall (Bat), and C. E. Bennett (Indian).

The winner's speed was 60½ m.p.h.

This race again proved an easy thing for Lee Evans, for he won easily by three parts the length of the straight. One hundred yards separated second from third.

Monday's Racing.

The Second Roadster Handicap, the Second Champion Plate, and six events for motor cars made up a good programme for this day, although more prominence was given to the car races. Very good performances were accomplished in all the events, and this was made easier by the wind dropping after the first race had been decided. We fail to see how some of the machines in the Roadster Handicap complied with the regulations, for most of their silencers were certainly misnamed, and but for the conditions printed in the programme as a heading to the race we should certainly have asserted that some of the machines were racers in disguise. If not racers, they were far removed from standard touring motor bicycles as usually used on the road.

The Second Roadster (?) Handicap.

The entrant of the winner to receive 7 sovs., or a cup at option; the entrant of the second 3 sovs., or a cup at option; and the entrant of the third 2 sovs., or a cup at option. Distance, about 8½ miles.

For motor bicycles, the cubic capacity of whose engines does not exceed 1,000 cubic centimetres. "Machines must be standard touring motor bicycles as usually used on the road. They must be fully equipped for the road, and fitted with not less than 2½in. motor cycle tyres, two brakes, metal mudguards, toolbag with contents weighing not less than 3 lb, stand and touring saddle, and with a petrol tank holding at least one gallon of petrol. All machines must have efficient silencers, and no cut-outs may be used."

Position.	Rider.	Machine.	No. of cylinders.	Cubic capacity.	Start
1.	G. Lee-Evans	(Indian) ...	2	638	35s.
2.	H. A. Collier	(Matchless)	2	964	scratch
3.	F. W. Bashall	(Zenith) ...	1	482	105s.
4.	G. Aldington	(Eland) ...	2	663	150s.
5.	O. C. Godfrey	(Rex) ...	1	482	85s.
6.	W. H. Wells	(Indian) ...	2	616	40s.

Also ran: R. Lord (Rex), A. G. Fenn (Rex), H. E. Parker (N.L.G.), W. E. Cook (N.L.G.), A. R. Abbott, jun. (Triumph), and E. C. W. FitzHerbert (four-cylinder F.N.)

The winner's speed was 57½ m.p.h.

This event again proved that Lee-Evans and the Indian have been under-rated by the handicapper. There was opposition for first place, although the issue was close between Collier and Bashall.

The Second Champion Plate.

The entrant of the winner to receive 8 sovs., or a cup at option; the entrant of the second 4 sovs., or a cup at option; and the entrant of the third 3 sovs., or a cup at option.

For motor bicycles the cubic capacity of whose engines does not exceed 1,000 cubic centimetres. Distance, about 8 miles.

Position.	Rider.	Machine.	No. of cylinders.	Cubic capacity
1.	C. R. Collier (Matchless)	2	964
2.	H. V. Colver (Matchless)	2	964
3.	L. C. Munro (N.S.U.)	2	995
4.	H. E. Parker (N.L.G.)	2	944
5.	H. A. Collier (Matchless)	2	964
6.	W. E. Cook (N.L.G.)	2	944
7.	W. H. Bashall (Bat)	2	964

The winner's speed was 69½ m.p.h.

This event provided an exciting duel between C. R. Collier and Colver, the issue being in doubt up to the last 20 yards. The third man was about the length of the straight behind them.

The last event of the day was the August Winners' Handicap, wherein Lee-Evans found himself pitted against the motor cars. These were: H. J. D. Astler's 59.2 h.p. Napier (scratch), Sir Geo. W. Abercromby's 39.5 h.p. Napier (1st start), and P. C. Kidner's 20.1 h.p. Vauxhall (1m. 12s. start). Lee-Evans had 1m. 46s. start. This event was finely contested, and travelling along the straight for home it looked as if Vauxhall was third and the smaller Napier last, very little odds on the big Napier getting home first, but, riding grandly, Lee-Evans just kept in front to the end. Vauxhall was third and the smaller Napier last, very little behind the winner. Lee-Evans averaged 60½ m.p.h., and received a well-deserved ovation for his fine performance.

LONDON TO LAND'S END AND BACK.

EVERE as is the test, both for man and machine, provided by the Motor Cycling Club's annual run to Edinburgh, and back at Whitsuntide, most members who have taken part in both agree that the run to Land's End and back in competition for the cup presented to the Club by its president, Mr. Charles Jarrott, is far and away the harder task of the two. The course is more varied, which makes the ideal of exact punctuality more difficult of attainment, and west of Exeter it is more rigorous than any stage on the North Road, while in the neighbourhood of Land's End itself, the combination of corners, hills, and holiday traffic serves as a severe test on the skill of the driver. On Saturday last the strenuous nature of the run down was greatly increased by the hindrance of a very strong easterly wind, which on the exposed portion of the road, especially on the north side of Dartmoor, and the high country between Launceston and Bodmin, put the riders of the smaller powered cycles extremely hard by maintaining schedule time.

Arms, Cranford Bridge, near Hounslow, for a four o'clock start. Four riders (G. L. Fletcher, W. W. Douglas, J. V. Robinson, and Eli Clark) used $2\frac{3}{4}$ h.p. Douglas machines, and there were eight men mounted on $3\frac{1}{2}$ h.p. Triumphs, viz., H. G. Bell, Stanley Webb, G. Purchase, H. Gibson, W. Cooper, C. C. Cooke, F. G. Smith, and E. Peppercorn. W. Mussell rode a $3\frac{1}{2}$ h.p. Rex and J. Winslow a 5 h.p. of the same make, and the remaining starters were F. A. Hard (3½ h.p. Norton), Owen Summers (6 h.p. Acacia), A. T. Stanton (3½ h.p. Bradbury), E. Gwynne (7 h.p. V.S.), G. Brough (5 h.p. Brough), D. S. Baddeley (7-9 h.p. Baddeley), L. A. Baddeley (3½ h.p. Yelladab), and H. Karslake and C. B. Moss Blundell (3½ h.p. nondescript machines).

All the starters got going in eighteen minutes, and Mr. F. T. Bidlake, who acted as official timekeeper, travelled the course as the guest of Mr. T. Pears on his 15 h.p. Rover, and was thus able to synchronise the records at all the intermediate timing places.

Immediately after the start H. Karslake was in diffi

London-Land's End-London, 55 miles. The start from Cranford Bridge at 4.0 a.m. on Saturday last. Immediately behind the centre rider is Mr. Charles Jarrott, the donor of the cup offered in this competition.

The scheme of scoring for the cup consists in the awarding of marks for the closest approach to exact punctuality, and for this purpose three secret checks were arranged at positions not specified in advance, the information given to the riders being that such checks would be within thirty miles of Basingstoke, Chard, and Mitchell on the down journey, and within the same distance of Redruth, Exeter, and Andover on return. Additional controls were provided at Salisbury, Sherborne, and Launceston to ensure that no competitor over-ran the time table, for a penalty of disqualification fell upon anyone being found at any part of the journey fifteen minutes too soon. There was, however, no trouble of this sort on the down journey.

Two Dozen Competitors.

The twenty-four entrants, all save one mustered at the small hours of Saturday morning at the Berkeley

culties, and lost half an hour, but by Basingstoke was up with his time standard, and there waited with his paired companion (H. Gibson) to assist in a tyre repair. In the first three miles Brough punctured on a nail. Later in the day, near Bodmin, Karslake sheared the shaft of his two-speed gear, and was forced to retire. Up to the first secret control (two miles west of Basingstoke), at 5.52 a.m., only one competitor was out of the running (G. L. Fletcher), who broke the tappet of the exhaust valve, and, though later able to proceed, he did not land at Penzance until some hours after the control closed. The brothers Baddeley appeared to hit off the required time with the greatest precision, and all the twenty-two men were through the Land's End and back portion of the route in sixteen minutes, so that the analysis of this sheet must show very close running. The hills round Chard affected the regularity of several men. Hereabouts Summers,

London to Land's End and Back.—

began a series of disasters, which, although not stopping him finally, caused him to arrive at the Exeter control an hour late. Persevering, he enjoyed the luxury of a hobnail puncture repair at Land's End. Winslow lost a little time through over-lubrication, and twice replaced sooty plugs, and Robinson also had a little delay from the same cause, which affected him, unfortunately, just in the neighbourhood of the timing station three miles east of Honiton. At this point H. G. Bell was within five seconds of absolute punctuality, and his journey down was without incident. He varied his gear from 4 to 1 to $4\frac{3}{4}$ to 1 at Salisbury, changing his belt to suit the altered pulley. Between this control and Exeter C. C. Cooke was stranded with the bearing of his front wheel adrift, and a stripped thread on the adjusting cone prevented further progress. A midday halt was called at Exeter, and under the control of Mr. E. Gould the men were restarted from Exeter Bridge at 1.12, having now covered $159\frac{1}{2}$ miles, and everyone felt the severity of the opposing gale on the next stage to Okehampton.

Approaching the third secret control, Mussell broke a belt fastener, and Moss Blundell smashed his exhaust valve. His delay put him late on the Penzance to Land's End stage, so that he ran into a fog, lost his way, and finished over three hours late. The stage between Penzance and the End was peculiarly fatal. Baddeley punctured at the very End, Hardy had tyre failure at Buryas Bridge, and Eli Clark had his belt rim break in Sennen. Nineteen men finished at Penzance, returning to Land's End for the Sunday, spent divorced from locked up machines.

The Return Journey.

By daybreak on Bank Holiday there was a scene of considerable activity in Taylor's garage at Penzance, for the nineteen men eligible for the return journey were allowed an hour's access to their machines previous to the start at 5 a.m. The tuning up process was in every case completely satisfactory, and a punctual start was effected for the homeward journey, which was twenty miles shorter than the Saturday run, owing to the Land's End and back portion being already covered.

A glorious dawn illumined the eastern sky, and run throughout was favoured by brilliant weather, wind having shifted to the north, keeping the ride cool, without the heating effects of a following breeze. Moss Blundell was early in difficulties, and was first to retire, while near Redruth D. S. Baddeley was forced to quit his brother's company, and give up further riding, owing to complete breakdown of magneto. After Redruth one of the thirty miles stages containing a secret checker was entered upon, and fully one half of the men went astray, headed by the trials honorary secretary himself. Fortunately the unknown location of the timekeeper was very soon on in the stage, being only six miles west of Bodmin, and before this point was reached the wanderers had returned to the course, and had hurried into punctuality, so absolute that Bell passed the milestone the tick of seven, and several others were within less than half a minute of accuracy. Hardy was the next man reported disabled, but this was the only incident reported to Launceston.

As on the down journey, a halt of 1h. 15m. was made at Exeter, where another control commenced. Stanton Webb executed a marvellously rapid substitution of sound for a punctured air tube, and W. Cooper had a broken front fork spring jury-rigged in Exeter. After the hidden check close running was again the rule, and thereafter the home run was free from incidents, save that Webb ceased near Salisbury, Douglas tackled two punctures in quick succession on Salisbury Plain, and the third control was hit off to a nicety near Andover at the sixtieth milestone. In the last lap a good deal of traffic dodging was required. Eight miles from the finish Purchase broke a valve stem, but the majority of finishers reported faultless running, and the fifteen who completed the journey at Cranford Bridge between 7h. 23m. and 7.46 p.m. were: H. G. Bell, O. L. Sumners, L. A. Baddeley, E. Gwynne, A. T. Stanton, W. W. Douglas, W. Mussell, G. Purchase, J. V. Robinson, G. Brough, H. Gibson, W. Cooper, J. Winslow, F. G. Smith, and E. Peppercorn. Among these is the winner of the cup, but his identity cannot be determined until the Club Committee adjudicates upon an analysis of the timing returns.

International Auto Cycle Tourist Trophy Race.

The third race for the International Tourist Trophy is to be held in the Isle of Man on Thursday, September 23rd. The regulations have already been published in these pages. The cylinder capacity limit for single-cylinder engines must not exceed 500 c.c., and multi-cylinder engines 750 c.c. The total distance of the course is 158 miles 220 yards. The start will be from

St. John's, thence to Ballacraigne, Kirk Michael, and by the coast road to Peel and back to St. John's. Fifteen competitors will be despatched at 10 a.m. Entries are accompanied with the fee of five guineas, must be received by the secretary of the Auto Cycle Union, Mr. F. Straight, 18, Down Street, Piccadilly, W., not later than September 1st.

Club News. (See also page 587.)**Hull and East Riding A.C.C.**

A reliability trial to Whitby and back is fixed for Saturday next for the Palmer Tyre Challenge Cup. Entries close Thursday, 5th inst., to the hon. sec., Mr. F. Boxhall, 165, Coltman Street, Hull.

Motor Cycling Club.

Communications from July 31st to August 21st should be addressed to the hon. treasurer, Mr. R. C. Davis, Standishgate, Southwood Road, New Eltham, S.E., as the hon. secretary will be away on holiday.

Coventry and Warwickshire M.C.

The supplementary regulations for the Coventry and Warwickshire M.C. open motor cycle hill-climbing competition are now in the hands of club secretaries for distribution among their members. Unfortunately, there is a slight error in the regulations respecting standard touring machine mudguards in Class 1. The regulations say metal motor cycle mudguards at least 4in. wide. This should read $3\frac{1}{2}$ in. wide. The committee found after the regulations had been printed that the average metal motor cycle mudguard did not exceed $3\frac{1}{2}$ in. Will intending competitors kindly note?

ADDRESS—20, TUDOR STREET, LONDON, E.C.

The Tourist Trophy Race.

THURSDAY, September 23rd, is the date of the International Auto Cycle T.T. Race in the Isle of Man. The start is to take place at 10 a.m. from St. John's, the course being as last to Ballacraigne, Creg Willey's Hill, Kirk Michael, by the coast road to Peel and back to St. John's map, p. 596, and contour accompanying this article). Competitors will make ten complete circuits of the course, making a total distance of 158 miles 220 yards. Single-cylinder machines must not exceed 500 cubic centimetres, and twin-cylinder machines 750 c.c. In previous years, the single cylinder machines have competed in a different class from the multi-cylinders, but this year all will compete together for the one prize—the International Tourist Trophy, presented by Marquis de Mouzilly St. Mars. Once and for all time the question will be settled as to which is the most efficient 1909 motor bicycle, the 3½ h.p. single-cylinder or the 5 h.p. multi-cylinder. Consequently the greatest interest attaches to this year's race, especially as on the occasion of the two previous years 3½ h.p. single-cylinder machines have averaged better speed than the multis, and withal on a lower

consumption of petrol, as will be seen by the particulars published on the next page. It must, however, be considered that the amount of fuel measured out to the multis was not thought adequate by those who made and bestrode them. The singles were allowed one gallon per hundred miles and the multis one gallon per eighty miles. Had petrol consumption been unlimited, a different result might have been recorded.

Definition of a T.T. Machine.

All motor cycles entered must be touring machines, without pedalling gear, fitted with two brakes, tool-bag weighing (with contents) not less than 5 lbs., motor cycle tyres (not less than 2 in.), metal mudguards (not less than 2¾ in.), touring motor cycle saddle, tank to hold not less than 1¼ gallons of petrol.

New regulations introduced for this year's event discard the petrol allowance (although it would be interesting and instructive if the A.C.U. checked and announced the consumption of liquid fuel), and there will be two depots along the route at which spare tyres, petrol, and lubricating oil may be taken in during running time.

Contour section of the T.T. course. The highest point is Creg Willey's Hill, which has an average gradient of 1 in 14½, and rises to 800ft. above sea level.

Tourist Trophy Race.—

No race will be held unless twenty entries are received, and the entrance fee of five guineas per machine must be received by the secretary of the A.C.U., Mr. F. Straight, 18, Down Street, Piccadilly, W., by the 1st prox. The A.C.U. will also hold a

hill-climbing competition on the Island a day or after the race, provided the necessary permission can be obtained.

The following particulars of previous Tourist Trophy Races will be of interest:

1907.—SINGLE-CYLINDER CLASS.

Position.	Name and machine.	Total nett time.			Miles per hour.	Petrol consumption			Miles per gallon.
		h.	m.	s.		gal.	pt.	oz.	
1.	C. R. Collier (3½ h.p. Matchless)	4	8	81½	38.2	1	5	10	94½
2.	J. Marshall (3½ h.p. Triumph)	4	19	47½	36.5	1	3	2½	114
3.	F. Hulbert (3½ h.p. Triumph)	4	27	49½	35.4	1	6	0½	90

Fastest circuit—H. A. Collier, 23m. 5½s.

TWIN-CYLINDER CLASS.

1.	H. Rem Fowler (5 h.p. Norton)	4	21	52¼	36.2	1	6	13	87
2.	W. H. Wells (5 h.p. Vindec)	4	53	41½	32.3	2	0	7	77
3.	W. M. Heaton (5 h.p. Rex)	5	11	3½	30.5	1	3	17	107

Fastest circuit—H. Rem Fowler, 22m. 6½s.

1908.—SINGLE-CYLINDER CLASS.

1.	J. Marshall (3½ h.p. Triumph)	3	54	50½	40.4	1	2	15	117.6
2.	C. R. Collier (3½ h.p. Matchless)	3	57	6½	40.1	1	3	11	109.5
3.	Capt. Sir R. K. Arbuthnot, Bart., R.N. (3½ h.p. Triumph)	4	7	57	38.2	1	3	15	107.2

Fastest circuit—J. Marshall, 22m. 20s.

MULTI-CYLINDER CLASS.

1.	H. Reed (5 h.p. Dot)	4	5	58½	38.6	1	6	18½	86.3
2.	W. H. Bashall (6-7 h.p. Bat)	4	8	15	38.2	1	6	16	85.1
3.	R. O. Clark (5 h.p. F.N.)	4	11	24½	37.7	1	4	19	90.8

Fastest circuit—W. H. Bashall, 22m. 27s.

AUSTRIAN VOLUNTEER MOTOR CYCLE CORPS.

ON the 25th ult. the newly formed Volunteer Motor Cycle Corps, which has already grown wonderfully in favour, held its first military test. Taking into consideration the short

time the test occupied, the number of participants was not large, as only a total number of twenty members took part. Of these no less than nineteen went through the whole of the test from 9 a.m. to 2 p.m., one only (the rider of a lightweight) failing.

The course selected was a difficult one, and it was rendered more difficult by the fact that it had been raining during the preceding night, and consequently the roads traversed were heavy and treacherous. The participants made use of various vehicles, some used lightweight motor bicycles, others 6 h.p. bicycles, while one or two drove sidecars and small cars.

The smart uniform of the Commandants of the Austrian Volunteer motor cycle corps.

The test consisted of reconnoitring the ground around the railway station, etc. At the conclusion of the test the founder of the 5th Division of the Imperial War Ministry (Oberst Höfer) spoke in praise of the manœuvres. The newly formed volunteer motor cycle corps comprises about 100 riders at the present time.

A COURIER RUN IN GERMANY.

For September 26th the Silesia-Posen branch of the German Motor Cyclists' Association, with the support and, indeed, co-operation of the military authorities, will organise interesting military courier runs over the Breslau-Posen and Thorn-Posen roads for the purpose of ascertaining in what degree light and heavy motor cycles are suitable for orderly express duties. Each rider will carry a despatch, and have to deliver it to a given rider in waiting at the stage terminus, who dashes off with the message at once. All the riders may continue the journey, and in the event of anyone overhauling the relief rider within five kilometres he is entitled to receive back the despatch. Anyone may also demand a despatch from any other despatch bearer overtaken, the object of the run being to have the messages forwarded by the fastest bearers.

[It would appear from the foregoing that there is far greater enthusiasm in German and Austrian military motor cycle circles than there is in England.—Ed.]

In the Essex Motor Cycle Club hill-climb on July 24th at Lippett's Hill, the single cylinder class was won, both on time and formula, by a 3½ h.p. Norton fitted with Simms magneto and Clincher tyres. The Norton was only ¾s. behind the fastest time of the day, which was made by a 5 h.p. twin-engined motor cycle.

OCCASIONAL COMMENTS.

By "IXION."

Hill-climbing Extraordinary.

I do not think the A.C.U. Trial ought to pass into comparative oblivion without mention being made of our remarkable hill-climbing achievements, which stand out head and shoulders from the general mediocrity. There were machines entered which everybody knew would climb well; instances are the two-speeded machines, the mounts of men like Godfrey and Marshall, and the high-powered machines which had adjustable pulleys. Others also climbed well when under official observation, but by dint of reducing pulleys and changing belts. Our machines, however, surprised the acute observer. Chief among them stands the Motosacoche, which twice passed a car in which I was seated, when we were doing somewhat better than legal limit up grades of about 1 in 20, while reference to our complete report will show that it shone on the test hills as well. Then I think the facts astonished everybody. It will be news to many readers that these machines had fixed pulleys giving gear of about $3\frac{1}{2}$ to 1. Granted their high power, the ability to negotiate Wenlock, Dinas, Festiog, and Birdlip under adverse conditions with a racing gear proves that these machines are tremendously efficient. Thirdly, a word of praise is due to the Douglas machines. They are not perhaps absolute featherweights, either in power or avoirdupois, but they carried normal riders, and their power is only $2\frac{3}{4}$ h.p., while the way in which they kept up with the man throughout shows that they were not under-gear. Yet they climbed the hills excellently, their horizontal twin-cylinder engines pulling like Trojans. Fourthly, the Moto-Rêve was a worthy member of my respected quartette. Whenever I saw it on a hill, its microscopic twin-engine was pulling steadily and smoothly. Incidentally, I never heard one engine out of the above quartette knock or plank on a hill. Readers will note that the above quartette consists of machines which in theory were very ill suited by such a route as that adopted for the six days.

Magneto Position.

Before 1910 designs are settled for good or ill, I want to make a last appeal to manufacturers to consider the placing of the magneto. The magneto must be kept both clean and dry if it is to be perfectly reliable and produce the highest efficiency. There are signs that the low down position in front of the engine is going to become standard, simply because

of its neatness and simplicity. But this is a position in which the magneto can seldom be clean and dry for long periods together. Its becoming standard would, therefore, be an event to deplore in my opinion. There are many alternatives. The small platform abaft the engine is technically far superior. The tank position, obtained by a long overhead bevel drive, has at least as much in its favour as against it. I hope two or three of our largest manufacturers will very seriously con-

The course for the Tourist Trophy Race in the Isle of Man, measuring nearly sixteen miles in circuit. Starting from St. John's, it will be covered ten times.

sider an alternative position for 1909. Covers are all very well, but after many experiments with different methods, I am inclined to call the gear-driven magneto placed abaft of the engine distinctly superior to any.

It may be news to many of our readers that the Service Co., of 292-293, High Holborn, is as well-known in the photographic world as it is among the motor cycling community. The company has one of the largest and best class photographic connections in this country. It has just revised its photographic list, and those motor cyclists who are also interested in photography would be well advised to write for a copy.

Speed and Power.

By R. W. Ayton.

"JUST what I want," joyfully exclaims the average rider;

"book me five shillings' worth at once." Or words to that effect.

As a matter of fact, there is no reason why he should not have a generous allowance thereof without undue expenditure. There are comparatively few engines on the road at the present time which are absolutely incapable of attaining a fairly high rate of revolution or of delivering a satisfactory power output, however poor may be their present performances. Except in the case of a small minority of weaklings, most of the engines at present classed as "poor" (in various degrees from "rotten" to "fairly good") are capable of substantial improvement at small cost.

Improving an Old Machine.

Take the case of the novice who I found the other day vainly trying to surmount a local test hill (gradient about 1 in 9) with a recently purchased second-hand machine fitted with an automatic valved $2\frac{1}{2}$ h.p. engine of good make, 1904 type. Gear ratio was reasonable, compression fair. Starting was very easy, the engine firing directly lifter dropped, and continuing to do so regularly at almost walking pace. Nothing much wrong in the carburation department evidently.

Inviting him to "have another try," I stationed myself a few yards up the first gradient. He got away promptly, and gathered speed well—at first. But from where I stood it was evident that acceleration ceased before he had covered the few dozen yards of comparative level, and to face such a gradient with a small engine lazily rolling over at a mere thousand a minute or less is hopeless. A long forgotten inlet valve was dug out from its carbonaceous cavern and carefully cleaned. The much worn spring, in places reduced to about half its original gauge, was gently pulled out, and the opening of the valve, almost doubled by pounding of steel cap on cast-iron guide, brought within limits by means of a $\frac{3}{16}$ in. washer from my tool box. With a few words of advice touching a new spring and cap, I

sent him up again. By the time he struck the gradient the little engine was fairly buzzing round and if the owner has fitted the replacements recommended he now probably climbs that hill without even the half-dozen turns of the pedals with which he assisted at the summit on the occasion in question.

Strength of Valve Springs.

To any reader who may be serving his novitiate on a machine of similar type I would say do not forget that there is only one strength of automatically operated inlet valve spring from which you can secure good all-round results. Every mile you travel tends to slightly further weaken the spring you have in use. Consequently, replace in time if you wish to keep

Competitors in the Senior Motor Cycle Handicap at the last Brooklands meeting. The nearest rider is F. A. Applebee (5 h.p. Rex) who finished fifth.

speed and power up to the mark. Failing a supply of suitable springs from the maker of the engine, a good tip is always to fit a spring as strong as can be used without impairing easy starting and slow running. A little experimenting in this direction may yield surprising results.

For very high engine speeds use a short, strong well-tempered "buffer" spring, occupying the annular space between the true valve spring and the guide and of a length allowing the valve to open quite $\frac{1}{16}$ in. before the cap comes into contact with its free end.

Speed and Power.—

is will save much wear and consequent undue increase of lift, will secure prompt closing, and last, but not least, will greatly reduce liability of valve leakages.

Most modern engines are, of course, fitted with mechanically operated inlet valves. Sometimes a distinct advantage can be secured by fitting slightly longer springs to these, so as to seat the valves more promptly and firmly. Unduly strong springs will, however, inevitably exact a penalty in the shape of broken valves, particularly if the cams have steep rising faces or are undercut at this point. Many of the more ancient engines of this type could do with new timing gear, as considerable advance has been made during the last few years in the art of valve setting for speed and power.

Valve Setting for Speed and Power.

Broadly speaking, exhaust valves are now made to open earlier and close later than was formerly the case, whilst the induction valve is made both to open and close considerably later. A good setting for our purpose would be as follows: Exhaust valve, opens early, closes 15° late; inlet valve, opens 30° late, closes 35° late in racing engines and 25° late in touring engines.

Another common defect, tending to limit speed and power, is bad balance. A simple and practical method of correcting this was recently described in these pages. For any but racing machines, and especially on touring machines unprovided with a two-speed gear, a high compression engine is a doubtful blessing. In some of the strongly built engines of other types, however, the compression is very low, and may be raised somewhat without seriously impairing the all-round efficiency of the machine. In such cases the addition of a cap or junk plate on the piston is the expedient usually resorted to. This should be allowed, in order to keep down weight, and where the piston can be safely drilled this should also be done, in order to preserve approximate balance.

Upon the important subject of the ignition it is impossible to say much within the limits of an article such as this. One might safely affirm that, setting aside the numerous classes wherein ignition is effected by high tension magneto, more machines have their speed and power limited by defective ignition apparatus than from any other two causes combined. Faulty wiring, imperfect connections, "wipe contacts" of inadequate design and material (their name is legion, and they dwell among the tombs of departed efficiencies), wrongly adjusted trembler coils, extravagant badly condensed platinum-devouring coils of both in and trembler types, defective "earthing" arrangements, mal-adjusted or untended "make and break," and poor accumulators exhibiting in various degrees the manifold shortcomings of their touchy and delicate race—all these afflictions exist to chasten the spirit of the novice, to enrich the vocabulary of the gain hunter and the pocket of the garage man.

Whatever your especial troubles, let your remedies be radical. Tolerate no imperfections in any department, and let anything in the nature of a defect be a thema unto you. Should you wisely decide to replace your current-wasting, defective old coil with a more reliable and economical article, do not for the sake of charity, sport, or whatever most appeals to you

sell the old one "cheap" to be of the short purse and confiding disposition. The wretched remains have only one legitimate application. The wood and wax will render them an excellent firelighter for a cold morning.

Multi-point Ignition.

Of all classes of motorists, the motor cyclist stands to derive the greatest benefit from the adoption of multi-point ignition or simultaneous sparking at two or three points as far apart as the construction of the engine may permit. The reason for this is that in these high speed engines the spread of ignition through the mass of the charge, rapid as it may be, is under most working conditions not nearly fast enough to ensure combustion being completed before the exhaust valve opens. This is the reason why the spark has to be so excessively advanced for high speeds, although such advances obviously entail a reduction in the degree of compression attained before the passage of the spark and a serious amount of undue back pressure or negative work thrown upon the ascending piston. Even under these conditions combustion is frequently incomplete when the exhaust valve opens. The blow-pipe flame character of the issuing blast can be easily observed by running the engine minus exhaust pipe, and may be taken to represent a waste of heat (e.g., power) which has been generated too late to allow of its conversion into work in the cylinder.

Consequently, if we simultaneously fire the charge at a number of points well apart from each other it follows that these local explosions will merge or blend, and thus obtain complete combustion, in a fraction of the time taken to secure a like result from any single point, more especially when the latter is situated at one side of the combustion chamber, as is usually the case. Therefore, in order to maintain a high engine speed, we are no longer compelled to "advance the spark" to such an extent as formerly; yet we shall attain a higher maximum pressure in less time, and expansion during the impulse stroke will become actual, instead of merely nominal, as at present.

The adoption of the principle in question will result in a substantial increase in power and fuel economy, provided that the application be properly carried out and suitable plugs employed.

A Proportional Gain in Power.

As many readers will no doubt be aware, Dr. W. Watson, Professor of the Royal College of Science, has certified that in a water cooled four-cylinder engine he obtained an increase in power of twelve per cent. and upwards by the use of two plugs sparking simultaneously, arranged one on each side of the combustion chamber. Remembering the fact that motor cycle engines are commonly run at much higher speeds than usually obtain in car engines, it is particularly interesting to the motor cyclist to note that the proportional gain in efficiency was found to increase with the speed of the motor. Not only can I confirm this, but from the experience gained during the experiments which led to my patenting the system in 1906, and also since that time, I can affirm that the still higher results obtained from the use in triangular arrangement of three plugs sparking in series are sufficient to amply justify this seeming complication. I am aware that very few engines are so constructed as

Speed and Power.—

to permit of such an arrangement being employed, but am endeavouring to secure facilities for the effective conversion of standard engines.

The higher pressures and temperatures attained by the use of this system naturally tell on the plugs, which are even normally the most vulnerable point of the modern motor engine. Having carefully considered the nature and causes of the many troubles and failures experienced in this department both on cars and cycles, I have been led to design a new type of plug which is calculated entirely to obviate the tendencies to set up pre-ignition and to sudden failure, both of which weaknesses appear to me inherent in plugs of standard patterns, more particularly when used in high speed cycle motors. The long-suffering editor will be invited to test and report upon this alleged improvement directly the makers are ready to supply.

Sparkign Plugs to be Avoided.

Meanwhile, with the memories of many failures prompting, I would offer a word of advice: If you wish for reliability, do not be persuaded into using for speed work plugs which have long wires, arms, or points projecting far into the combustion space. Every millimetre on the length of such parts represents an added danger—an increased risk of elusive and oft-times mysterious troubles, such as falling off in power, sudden stoppages, and the like. Failures of this class I have on so many occasions traced to the use of such plugs that I now shun the latter as I would the plague. "Taking the spark into the mixture" is all very well in theory. The more satis-

Mr. C. A. Crow sends us the above photograph showing he and his brother starting out equipped for their 1909 summer (?) tour. He adds that it is not generally known that a complete suit of black oilskins can be bought for under ten shillings.

factory practice, however, is to keep the electrodes in close neighbourhood to the metal which is to conduct away their superfluous heat, and to see that the mixture gets to the spark.

Carburation.

To the reams that have been written on the subject

Four of the competitors about to leave Penzance at 5 a.m. on Bank Holiday Monday in the M. London-Land's End-London Run for the Jarrott Cup.

of carburation there is little need for me to. Automatic and semi-automatic carburetters continue to bloom and boom at intervals, but the majority of these devices have realised that "brief life is here and gone." Seeing how the capabilities of many engines have been restricted by ill-considered attempts to attain the unattainable in this direction, the motor cyclist may still feel thankful for the small improvement represented by the "air lever" on his handle-bar. The position, in fact, is very much what it was in the autumn of 1904, when, after patiently testing a type submitted, I reported to a well-known firm of manufacturers as follows:

"*Carburetter.*—This question has remained unsettled. Do the directors think that a so-called 'automatic' carburetter would be an attraction or will the average customer be convinced of the superiority of the controlled type? My preference is, of course, for the latter. Throttle might be with advantage controlled by the handle-bar."

In setting a carburetter for maximum speed and power the thing to go for is the largest diameter throughout consistent with the necessary flexibility of the engine and control over proportions of fuel and air in the mixture. There should be no reduction of area at any point in "full open" positions.

No matter in what form of competition you engage do not gear your engine too high.

In conclusion, I hope that one or other of the foregoing hints may be of service to some of your readers in "keeping their end up" in competition.

Motor cyclists who are also golf enthusiasts will be interested to know that the golf club carrier which was recently reviewed in *The Motor Cycle* has been taken in hand by Brown Bros., Ltd., Great East Street, E.C., and will be marketed in future under the name of the Bogie golf club carrier. A descriptive circular illustrating the device, which is certainly a very practical method of carrying clubs, will be sent on application to the firm at the above address.

QUESTIONS AND REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor St., E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Lubricants for a Motor Cycle.

? (a) Can I use castor oil as a lubricant for (1) cylinder and (2) bearings of my 1909 Triumph? (b) What should be the lowest flash point of a cylinder oil for an air-cooled engine?—BK 423.

(1 and 2) It is not desirable to use vegetable oil, except in cases of emergency when no other can be obtained, and then the cylinders should be cleaned out in two or three days' time. (b) The lowest flash point should not be under 450° F. The flash point of most really good oils is nearly 550° F. We advise motor cyclists to be most careful in the selection of an engine lubricant, and, once having found a satisfactory oil, always to use that brand.

Leakage past Valve Seating.

? I have a 3½ h.p. White and Poppe engine, and cannot get proper compression, the reason being the inlet valve and detachable seatings. I take off seating and grind in valve, but when bolting up again (one bolt each side) and using copper asbestos washer, the seating springs up each side with the pull of bolts, thus preventing the valve taking a proper seating, and allowing leakage. What would you advise?—F.M.

Probably the washers you use are too hard. Obtain a new one and when tightening down the seating be careful to screw up each nut one turn alternately. This should prevent one side springing up. You could also try painting the joint with fish glue, but you still cannot get good compression write the makers of your engine.

Exhaust Whistles.

? I have ordered a 1909 Triumph machine, and want to have a whistle or organ horn fitted to the exhaust. I shall be glad to hear from you as to which is the better, and whether it would be possible to fit one to a Triumph motor cycle, and kindly say if same should be fitted to the exhaust box or exhaust tube.—F.R.

One should say that it would be possible but hardly desirable to fit an exhaust whistle to act as a warning for your machine. Being a single-cylinder, it could give a series of unpleasant shrieks, and it would also exert a good deal of back pressure. The same remarks we should apply to the organ or Gabriel horn (to which we presume you refer). Consult Brown Bros., Ltd., Great Eastern Street, E.C., on this question.

Carburettor Control and Slow Running.

? (1.) My 3½ h.p. motor cycle is fitted with Amac carburettor with handle-bar control. This slows by drawing the two levers together. When raised as much as possible, ought I to be able to cut off the entire supply of gas? At present with levers in above position and spark fully advanced, machine runs fourteen or fifteen miles per hour on level. (2.) The main air intake is facing the side of the machine. What would be the effect of turning the opening towards front of machine (if it will turn)? (3.) In reading instructions re machines with magneto, these generally say that spark should, as a rule, be fully advanced. In going through traffic I find my machine travels too quickly if set in this position, with other levers as stated above. Does any harmful effect follow if the magneto spark is set for slower sparking?—DI 24.

H. S. Wallis, 2½ h.p. King, passing H. P. Storey, and winning the five miles open handicap at the Cambridge Mammoth Show on August Bank Holiday.

(1.) The throttle lever when quite closed should prevent any gas entering the cylinder. This will economise fuel, and also enable you to use the engine as a brake when descending hills. (2.) You had better leave the air intake as it is. If you turn it to the front it will probably draw in a lot of dust, and probably too much cold air. (3.) The reason your machine travels too quickly in traffic is because you cannot throttle down sufficiently (see first query and reply), although the running position of the magneto lever depends on how the spark is timed. Do not retard the ignition in traffic unless the engine knocks. It will do no harm to slightly retard the timing.

Power on Hills.

? I have a 3½ h.p. Minerva, 1908, Eisemann magneto, geared 5¼ to 1. My weight is 11 stones, but the machine is weak on hills, although it will attain a high speed on the flat. Compression is good, valves in good order, firing all right, and I have varied the timing a little. I have also tried an Amac carburettor. Would raising the compression give me more power on hills? The cylinder, I think, would stand it.—W. J.

Hill-climbing depends chiefly on good compression. If your engine will not bear your weight on the pedal for half a minute, you should turn your attention to the condition of (1) the valves, (2) washers under valve and compression taps, (3) the piston rings and the fit of the piston in the cylinder. The gear is about right for your weight, and we should not recommend you to alter the ratio of the compression. You might, however, try a slightly larger jet, but if the engine overheats return to the original one.

Altering the Type of Ignition.

? I am the owner of a motor cycle with accumulator ignition, make and break contact, plain coil. (1.) Would you kindly tell me (assuming that I could find a reliable method of driving it) whether I should get a spark and a good one if I connected a four volt dynamo to the existing wires which are now connected to the accumulator, e.g., leave wiring, contact breaker, coil, etc., exactly as at present, but substitute dynamo for accumulator. (2.) I have an old telephone magneto, and have rewound the H armature, and it now at a moderate speed lights brilliantly a four-volt lamp. Could I use this as mentioned above? (3.) Would coil be damaged at high speeds by too large a current passing?—J.H.L.L.

(1.) Such a system of ignition is quite possible, and, in fact, it was practically on the market for motor cycles a few years ago. The particular system which we have in our minds necessitated a special coil and an extra large condenser. (2.) It is possible that the machine referred to might do, but it would not be so satisfactory as a magneto. Probably for a very slightly increased expenditure you could buy a second-hand magneto by a well-known manufacturer, which would suit you infinitely better. (3.) There is a risk of the coil being damaged unless a complicated cut-out and governor are provided.

Various Queries.

?

(1.) Is a machine weighing 112 lbs. too heavy to start by mounting in the usual way and pedalling? (2.) Will a Watawata belt run satisfactorily with a 2 $\frac{3}{4}$ in. pulley on the engine? (3.) Are springs sold for fitting on the forks of existing machines quite reliable and satisfactory? I mean such as the Matchless. Are they sufficiently free from side play?—J.B.

(1.) No, a 112 lbs. bicycle is not too heavy to start by pedalling on level ground. (2.) We should not advise an engine pulley under 3 in. in diameter. (3.) Yes, it is, we believe, quite free from side play.

Under-powered for 11 $\frac{1}{2}$ Stones.

?

I ride a lightweight twin, which, though excellent on the flat or slight gradients, I find too weak on hills and against strong head winds. My weight is about 11 $\frac{1}{2}$ stones, but my area of wind resistance very great, as I am over six feet in height. Compression is excellent. Carburation is, I think, right, though the machine will not take full air to give best running with full gas. Petrol level correct. (1.) Would increase in size of jets give increased power? (2.) Do you think increasing the degree of compression by adding a thin plate to top of the piston would give me an appreciable increase of power? If so, would an eighth of an inch be about right? Would you advise it being convex, as that seems the favourite piston top just now? Would this materially increase the difficulty in starting? (3.) As an alternative to this, would it be possible to bring the attachment of the piston rod nearer to the circumference of the flywheel, so as to increase both the down stroke and the up stroke, and so increase both the amount of gases and the degree of compression? If so, how much do you think one could gain? A $\frac{1}{8}$ in. or more?—H. S.

(1.) A larger jet would give more power, but might probably tend to overheating. (2.) We should not recommend you to increase the compression. The engine is so small that it might not increase the difficulty in starting, but it would probably render the engine more liable to overheat. (3.) Not without running into a good deal of expense, which we should say would not be worth while. We are afraid the only thing to do would be to get a slightly more powerful machine, as experiments of this kind are often likely to run one into great expense without attaining the desired results.

Engine Knocking and its Causes.

?

About a year ago I began to read your valuable journal with a view to buying a motor cycle. Since that time I have constantly read in the letters of "knocking," and have naturally been very curious to know what it is. Friends could not exactly explain it, but I "would soon know it when it came." I have ridden my

machine 2,600 miles so far, but it was not until I had reached 2,300 that, when trying a very steep hill, my machine suddenly gave forth a sweetch, sweetch, sweetch. When I so described it an experienced motor friend told me it was "knocking." I should be very grateful if you would answer the following questions: (1.) Why have I since that time experienced knocking on every ride? Latterly it has been very constant, and at even slight hills. (2.) Even supposing that I have had more than the average carbon deposit for the last 600 miles (I cleaned it all off at 2,000 miles), why should my machine give signs of knocking when I restart after a stop and knock badly on ordinary hills? If "compression is power," if carbon deposit raises compression, and if again the compression of my machine is (as it actually is) perfect, I presume it ought to be less likely to knock? (3.) But what exactly is knocking? Does it do the machine any harm? If so, in what way? (4.) Once a machine has begun to knock will it do so again more easily under like conditions? Will it, in other words, "grow on" the machine like a bad habit might grow on?—D 4139.

It is difficult to find out whether you actually experience knocking or the screech of a bearing in want of oil. Probably, as you say, you have an excessive amount of carbon deposit on the cylinder head and piston. Up to a certain point it is practically true that a small amount of carbon deposit is more beneficial than otherwise when it gets excessive it causes overheating, and overheating in turn causes flakes of carbon deposit to become white hot. This produces pre-ignition, and what happens is that the piston has to rise against the full force of an explosion, with the result that you hear a noise which may be best described by the word "clink." This noise comes either from excessive carbon deposit or from the cylinder requiring oil and being, at the same time, excessively overheated. This, we think, describes what "knocking" is, and the harm it does results in the looseness of the bearings, and possibly in very bad cases with the bending of the connecting rod. Once the noise has been removed there is no reason why it should occur again. Knocking is also caused by—(1) Play in the bearings; (2) wear of the piston and cylinder; (3) spark too much advanced; and (4) too much air in the mixture.

The M.C.C. London to Land's End and back run, 555 miles. This year a day's rest was arranged between the outward and homeward journeys. The photograph shows most of the competitors at Land's End.

CORRECT TIMING

of valves and ignition is absolutely essential to smooth running in a twin-cylinder engine. Hence the number of disappointed owners of "twin" machines.

In the case of the

MOTO REVE,

THE LUXURIOUS
LIGHTWEIGHT,

two things ensure exactness. The valves are equipped with adjustable tappets, thus permitting the finest possible adjustment; the special design of the magneto secures synchronized firing at all speeds (see "The Motor Cycle," Aug. 4, p. 581).

Write a postcard for fully illustrated details. Our offer of a free demonstration run still holds good. Can you accept?

Good luck
to it--and to the cyclist
who uses it!--It is LYCETT'S
"LYSO"

The Leading Rubber Belt.

—We say "Rubber" advisedly, because it is practically all pure rubber—not composition—despite the present high price of rubber.

The NEW Belt.

The REAL Belt.

The TRIED Belt.

—We do not claim perfection for this Belt without practical and exhaustive TESTS. It will interest every cyclist to learn that this Belt has been undergoing tests of all kinds since last March and we have made quite sure that it is a real LEADER before proclaiming it to the motoring world.—Regarding its performances

TOM PECK says: "You will be pleased to hear that I used your new 'LYSO' Belt with the Patent Fastener on my Motor Cycle when I broke the Land's End to John-o'-Groat's record on May 24th and 25th. The BELT gave EVERY SATISFACTION. IT DID NOT SLIP OR STRETCH, AND ONLY ONE BELT WAS USED THROUGHOUT THE WHOLE RIDE."

S. C. PERRYMAN says: "Up to the present the 'LYSO' Belt has run about 1800 miles on a heavy 6 h.p. Twin. The last 500 miles were run through Derbyshire... during very wet and muddy week... and the Belt was not spared at all. It is without doubt the MOST FLEXIBLE RUBBER BELT that has yet been produced. I consider it was this quality which enabled me to score fastest time in the Birmingham M.C.C. Hill Climb at Ankerdine. The Belt pulls steadily, is still apparently GOOD FOR ANOTHER 1800 MILES, and IS MY MOST CHERISHED POSSESSION IN THE MOTOR LINE. Wishing you every success."

MR. NORTON, who used our new "LYSO" Belt in the Essex Hill Climb, and WON FIRST PRIZE, says: "AM QUITE ENTHUSIASTIC OVER THE WAY IT PULLED."

—This "LYSO" Belt is positively the strongest, most flexible, clean, durable, and CHEAPEST BELT on the market. Study the illustration—note the Ribs underneath and above, the new suction holes at sides, the gap-less Fastener, etc., and think of the enormous benefits these improvements bring. Although it is the best belt that is made—and therefore should be the most expensive—we have decided, in the matter of price, to err on the sensible side, and market it at a price which places it within purchase of everyone.

We are making the two most usual sizes at present—in $\frac{3}{4}$ " size our

PRICE is 1/6 per foot,

and in 1" size, 1/10 per foot, and this price includes our well-known Patent Fastener as illustrated. Other sizes follow.

—You should have one without delay when you will realize the truth of our last week's assurance "You're in for a good thing."

,, 18 .. 8.16 ..

The Next Brooklands Meeting.

Saturday, October 2nd, is the date of the next race meeting at Brooklands. Details of the events for motor cycles will be announced later.

Two Wins on Saturday and Two on Monday.

Last week we were inaccurate in stating that Lee-Evans won five events at the last Brooklands meeting on a 5 h.p. Indian, as his successes totalled four, not five.

Germany's Imports and Exports of Motor Cycles.

Germany's trade returns show that during the first half of the current year she imported 99 motor cycles, or 110 fewer than in the corresponding period of 1908. Her foreign sales, however, were augmented, 1,116 motor cycles being sent out, or 93 more than in the preceding year, the respective values being £33,550 and £31,900.

The A.C.U. Quarterly Trial.

In the last Quarterly Trial, sixteen single-cylinder motor bicycles, five twin-cylinder, and one four-cylinder made non-stop runs, three single-cylinder tricars obtaining full marks in the passenger class. The contest for the silver cup in the four trials of 1909 has now reached its semi-final stage, and the scoring is as follows: Triumph Cycle Co., Ltd. (J. Marshall), 296 marks; Premier Cycle Co., Ltd. (G. E. Stanley), 295; Triumph Cycle Co., Ltd. (W. F. Newsome), 289; R. Griesbach (private owner), 283; N.S.U. Co. (R. J. Bell), 275; and W. Pratt, 271.

Two Motor Cycles Stolen.

The following particulars describe two Triumph motor bicycles stolen within the last fortnight, and will enable readers to identify them if offered for sale. The first was taken from Muswell Hill, and is the property of G. Howe, Park House, Sydney Road, New Southgate, N. The engine number is 2,207. Date of delivery, 29/10/07. Cylinder head chipped near exhaust port.

The second is W. Dewar's T.T. Triumph, and was stolen from the garage at Brooklands on Saturday, July 31st, between 4.20 and 5.30 p.m. The engine number is 5,951; frame number, 140,255. The machine is minus mudguards, stand, and carrier. Tyres are Dunlop 24in., and carburetter is specially cut away in half crescents on both sides. There are two holes in the induction pipe fitted with hub lubricators, and the bottom fin of cylinder is broken below inlet valve. Mr. Dewar's address is 14, Anhill Road, Grove Road, London, E.

The Isle of Man Race.

If the necessary permission can be obtained, an open hill-climb will be held in Manxland on September 24th, the day after that of the T.T. Race. The Auto Cycle Union will, of course, organise the event if it is held.

The London to Plymouth and back Run.

The committee of the A.C.U. has seriously considered the question of allowing the three riders who were disqualified for excessive speed in the London to Plymouth twenty-four hours run from taking part in any future competitions promoted by the Union.

The Speed of Motor Cycles on Hills.

In the Bradford M.C.C. open hill-climb at The Steep, Denholme, the following speeds were accomplished by the winners of the different classes: Single-cylinder standard class—E. S. Myers (3½ h.p. 1909 Triumph), 36 m.p.h. Twin-cylinder standard class—Felix Scriven (5 h.p. Rex), 38.7 m.p.h. Racing singles—F. Mackay (3½ h.p. Triumph), 43 m.p.h. Open-to-all class—L. W. H. Bashall (8 h.p. Bat), 48 m.p.h.; 2. J. Scriven (5 h.p. Rex), 47.8 m.p.h.; 3. O. C. Godfrey (3½ h.p. Rex), 45 m.p.h. (fastest single-cylinder). It is interesting to compare the above speeds with regard to the power, and it also shows how big an advantage special speed models have over the comparatively heavy tourist machine.

SPEED AND POWER.**THE TOURIST TROPHY RACE.
REGULATIONS.****Straying Horses on the Road.**

At King's Heath Police Court, on the 30th ult., James Corbett, Manor Farm, Wythall, was summoned for allowing five horses to stray in Shaw Lane, Hollywood. Two motor cyclists made a complaint to a police constable and the five horses belonging to the defendant were found straying in Shaw Lane off the main road. Defendant said he took every care to keep the animals in his field, but someone had left the gate open. The magistrates fined defendant 2s. 6d. and costs. At the same court on the same day S. Hargreaves was summoned for driving a motor bicycle at a speed dangerous to the public at King's Heath. He was alleged to have travelled at a speed of thirty miles an hour. Hargreaves denied the charge, estimating his speed at about eight miles an hour. He also stated that the engine was not firing at the time the officer held up his hand. The magistrates fined the motor cyclist 20s. and costs. Although it would not be fair to fine an owner of horses for negligence on the part of another person, the inconsistency of the two fines is apparent to anyone, and shows that the magistrates have one scale of fines for danger to one section of the public, and another scale for motor speed alleged to be dangerous. Magistrates seem to regard all motor cyclists as men of means.

One of the hairpin bends on Amulree Hill, showing incidentally two Scottish Trial competitors "bus." This exceptionally severe climb, which includes stretches of 1 in 5, and two sharp corners, demands a two-speed gear, although it has been climbed three times in succession by a 3½ h.p. single geared pedalless touring bicycle.

Muratti Trophy Trials.

The Muratti Trophy Open 400 Miles Reliability Trials in connection with the Ulster Centre Motor Cycle Union have now been fixed for the last days in the present month.

Land's End and Sidecar Record.

Land's End to John-o'-Groat's on a bicycle and sidecar record was established last week by Vivian Olsson, total time being 65h. 14m. This is the first time such a long and arduous journey has been attempted on a passenger motor cycle.

Accident Driving of a Horsed Vehicle.

C. Lucas, a native of St. Helier, Jersey, was charged on the 27th ult. with driving a horsed vehicle in a careless manner and causing an accident to Col. Joseph Espin Dickinson, who was riding a motor cycle. The magistrate said that accused had been very negligent, and that he would have to pay a fine of £6 or go to prison for a fortnight. The fine was paid, so we can only presume that Lucas is paying for his little escapade of a fortnight's confinement.

Sidecars in the U.S.

Although it may seem a curious fact to British readers (writes a Pittsburg correspondent), outside Chicago the sidecar is locally unknown. Greater Pittsburg, with its 600,000 inhabitants, cannot boast of a single sidecar; in fact, a sidecar when used always requires a very explanation as to its meaning, the production of an illustration of a sidecar excites considerable curiosity. This is not surprising when one takes into consideration that the wheel on pedal bicycles was in use long before it had attained the height of its popularity in England before anyone had fitted it to a modern safety bicycle. Even now it is seldom seen in the States.

London-Land's End-London Run.

Some comparisons between last year's event are interesting: S. G. Frost won the Jarrott Cup, London-Land's End and back run, and also the Motor Cycling Club Challenge London-Edinburgh and back, in 1908.

His performance has been repeated this year by F. G. Smith. Frost's best approach to punctuality on last year's run in any one of the six timed stages was ten seconds. Smith's best in this year's run was 16s., his consistent running throughout winning him the cup, which he richly deserves. Last year S. G. Frost (winner of cup), O. L. Summers (runner up) and H. G. Bell (third in order of merit), each got within 10s. of punctuality at one or other of the timing points. This, has, however, been repeated by several riders in this year's run. H. G. Bell, the trials champion of the club, as reported in last issue of *Motor Cycle*, arrived absolutely on time at one timing point, and was 5s. at another. Serious misadventure at two other points, however, cost him the cup. G. Brough at one point was only 2s. out, and at another 4s., and G. Purchase got in 3s. at one point. A. T. Brown, W. Mussell, and G. Pepper each got within 15s. at one point.

Scottish Five Days' Reliability Trials.

We are informed by the hon. secretary of the above, Campbell McGregor, that J. D. Morrison (6 h.p. Matchless) qualified for a silver medal and certificate, not R. S. Morrison, as stated in our report of the event. The committee would like to take this opportunity of thanking the F.N., Rex, R.O.M., and Triumph Co.'s for their very kind support, also the numerous friends who assisted in checking.

Mont Ventoux Hill Climb.

This event is to take place on the 4th and 5th September. There are three classes for motor cycles: Class 1, under 2 h.p.; Class 2, over 2 h.p.; Class 3, tricars carrying two persons, no engine limits. Any touring machine which can climb this hill without pedal assistance can truly be classed as a real hill-climber. Motor cycles which have performed well on the hill up to the present have been high-powered racing machines, which can only be manoeuvred round the corners by very expert riders. Giuppone (now the driver of a racing car) once

annual Tour de France trial has been postponed, either through lack of entries, or enthusiasm, or both.

Records.

Hitherto the only classes of records recognised by the Auto Cycle Union have been those for machines with "engines not exceeding 76 x 76" and machines with "any size engine." It has now, however, been decided to recognise records made in a number of other classes, namely, those made by machines with engines having a cylinder capacity not exceeding 275 cc.; not exceeding 344 cc.; not exceeding 500 cc.; not exceeding 750 cc.; not exceeding 1,000 cc.; and exceeding 1,000 cc.

The Quarterly Trials.

We are asked to state that the reason Mr. W. Hewitt, jun. (3½ h.p. Excelsior), failed to obtain an award in the last A.C.U. Quarterly Trial was that he had lost no marks, when, unfortunately, a rider who was in front on one of the test hills dismounted just as Hewitt was about to pass him, and a fall resulted, doing more damage to the machine than stated in the official report, or that he was aware of at the time. This accounted for the disarrangement of the gear and the slipping of the belt.

Motor Cycle Racing at Cambridge.

At the Cambridge Mammoth Show Sports at the beginning of last week, the three miles open motor cycle handicap was won by H. P. Storey (2¾ h.p. Cocks); 2nd, P. V. Wallis (2¾ h.p. King); 3, H. Martin (2¾ h.p. Martin); 4, W. Hodgkinson (2¾ h.p. J.A.P.). Winner's time, 5m. 17½s. Harry Martin afterwards attempted the five miles track record of 8m. 29½s., and was successful in clipping 2½s. off the record. A three miles open scratch race was won by P. V. Wallis, H. Martin finishing second, H. S. Wallis (2¾ h.p. King) third, and W. Hodgkinson fourth. Winner's time, 5m. 23s. The last event, a five miles open handicap, resulted in a win for H. S. Wallis, H. P. Storey being second, P. V. Wallis third, and H. Martin fourth. Winner's time, 8m. 39½s.

Quadrant Motor Co. v. O'Brien.

On Tuesday, the 3rd inst., at the Birmingham Assizes, Mr. Justice Bragg, sitting without a jury, gave judgment in a case in which the Quadrant Motor Co. claimed damages from E. S. O'Brien and Ada O'Brien, his wife, trading as the Challenge Cycle Co., Coventry, for breach of contract. The breaches were in respect of contracts made between William Priest, of the Quadrant Motor Co., and the defendant O'Brien for the manufacture of bicycles. The plaintiffs sought a declaration that they were entitled to the name Quadrant, and the defendants counter-claimed for damages stated to have arisen partially out of the difference between the contract price for the bicycles and the market value. Defendant also sought an injunction restraining the plaintiff company from using the name Quadrant. A settlement was arrived at, and judgment was agreed to for the Quadrant Motor Co. in the two actions for £500 and costs, and also in the counter-claim, the Quadrant Motor Co. to have the sole right to the use of the name Quadrant.

FUTURE EVENTS.

Aug. 18—British M.C.R.C. Fifth Members' Meeting at Brooklands.

Aug. 21—Coventry and Warwickshire M.C. Open Hill-climb for Motor Cycles.
Class I. Full Touring Machines.
Class II. T.T. and Special Machines.

Aug. 27 and 28—Essex M.C. 24 Hours' Ride. Woodford to York and back.

Aug. 30-31—Muratti Trophy Open 400 Miles Reliability Trials in connection with the Ulster Centre M.C.U.I.

Sept. 1.—Entries close for the Tourist Trophy Race on Sept. 23rd.

Sept. 23—THE TOURIST TROPHY RACE FOR MOTOR CYCLES IN THE ISLE OF MAN.
Limit cylinder capacity.
Singles: 500 cubic centimetres.
Twins: 750 cubic centimetres.

Oct. 2nd.—Race meeting at Brooklands.

climbed the hill on a lightweight by dint of hard pedalling, and we believe that several other lightweights have climbed it with laborious pedal assistance, but the ideal mount for a hill of this kind is a good motor cycle with variable gear. As there are signs that the British-built pedal bicycle is gaining favour in France, we should say it would be to the advantage of any manufacturer of a good variable-gear motor cycle to compete in this event, and to demonstrate to our French cousins that the motor cycle as made in England is almost a perfect touring mount. The popularity of the motor cycle is nothing like so great in France as it is in England, due in all probability to motor cycle manufacturers having turned their attention to the manufacture of small cars. Many names which a few years ago were a household word in English motor cycling circles are now no longer heard of, except in connection with voiturette manufacture. Even the

END-TO-END SIDECAR RECORD.

M R. VIVIAN OLSSON, with Mr. Charles Talbert as passenger, has succeeded in establishing a motor bicycle and sidecar record from John-o'-Groat's to Land's End. The machine used was a 7 h.p. twin-cylinder two-speed V.S., and the sidecar a Mills-Fulford fixed wheel. Mr. Olsson prepared for this record in a very systematic way. He chartered the services of a timekeeper, D. K. Hall, who gave the word to start at 1.35 a.m. last Thursday, and also travelled to Land's End to check the rider at the finish and examine the seals around the cylinders and frame which he had fixed at the start. These were found to be intact. Mr. Olsson had a supply of postcards on which were printed the following:

JOHN-O'-GROAT'S TO LAND'S END.

Mr. Vivian Olsson and Mr. Charles Talbert arrived here at and left at

Riders' signatures

Witnesses

Dated this day of August, 1909.

These postcards, duly signed, we began to receive immediately after the start, and thereafter they arrived regularly, showing the excellent progress being made by the record breakers.

Dingwall was reached at 8.25 a.m., Blair-Atholl at 2.10 p.m., and here a thirty-five minutes' stop was made. At 10.15 p.m. Lanark was reached, the riders resting here until 2.30 a.m. Friday. Pressing onwards Carlisle was the next stopping place, the time of arrival being 6.30 a.m., and time of departure 7.30 a.m. At 1.50 p.m. Wigan was reached, and a forty minutes' halt was made here. At 10.15 on Friday evening the record breakers reached Worcester, and rested here until 3 a.m. At Bridgwater the time was 9.15 a.m., and a thirty minutes' stop was made.

The journey's end was reached at 6.49 on Saturday evening, the total time elapsed since the departure from Land's End being 65h. 14m. The motor bicycle ran with great regularity. Two punctures were experienced in the back tyre, and the operating rods for the low gear were adjusted once. The sidecar attachment gave some trouble, on account of the bolts supporting the front portion shearing twice. The first time the passenger just saved himself from going out backwards. With the exception of some rain near Denny, the weather was perfect during the whole trip. Up to the present there has never been an attempt to establish a Land's End to John-o'-Groat's passenger motor cycle record, so that Mr. Olsson may feel proud that his first attempt has proved so entirely satisfactory. His average speed, including all stops, was between fourteen and fifteen miles per hour.

Vivian Olsson, 7 h.p. two-speed geared V.S. and Mills-Fulford rigid sidecar being checked in at Land's End by timekeeper D. K. Hall

NO INLAND REVENUE LICENCE.

"The Motor Cycle" helps to secure the dismissal of a case.

A T Spalding Petty Sessions on the 3rd inst., Theophilus Buckworth, of Reform Street, Crowland, cycle agent, was summoned for using an unlicensed motor cycle at Crowland on July 5th.—Defendant denied the offence.—Inspector Brackenbury stated the case.—Defendant claimed that he was exempt as he used his motor cycle solely for business purposes.—Supt. Burton maintained that the cycle was not solely adapted for business purposes, as he contended it must be.—Defendant said he had always said until he saw a paragraph in *The Motor Cycle* to the effect that photographers and newspaper boys using motor cycles in their business were entitled to exemption. This was a great point with the R.A.C. and A.C.U., and he dare say they would appeal against it if he were convicted.—Supt. Burton: We shall be quite prepared to meet it.—The Magistrates retired, and were absent for some time. On their return the Chairman said the majority of the bench were of opinion that the case should be dismissed.—Supt. Burton: Might I ask your worships on what

grounds it has been dismissed?—The Chairman: Because we find it is used entirely for business purposes. That is the opinion of the majority of the bench.—At the close of the court, Supt. Burton asked the bench to state a case. The point would arise again, and it would be better to have it settled.—The Chairman said the majority on that question was that the cycle was used entirely for business purposes.—Supt. Burton: That is the point. I maintain that it does not come within the meaning of the section. It is not adapted solely for use in business.—The Chairman: Do you want a case.—Supt. Burton: Yes. It is a point that should be settled.—The Chairman said Mr. Marples would look into the case.—Supt. Burton said the man declined to take out a licence, and said that he used the cycle entirely for business purposes, and that was their worships' decision. On that he was dissatisfied.—The Chairman intimated that the Clerk would look into the matter. We understand that the Superintendent has decided to risk the ratepayers' money and lodge an appeal.

M.C.C. London-Land's End-London Run.

The Results.

A T a meeting of the committee of the Motor Cycling Club held on Friday evening last the checking sheets and timing records of the London to Land's End and back reliability competition were analysed. Owing to a discrepancy between the route card and the correct mileage between Mitchell and Redruth, the intermediate punctuality check at this point was cancelled, and the award was made irrespective of the scores in this control. The trophy presented by Mr. Charles Jarrott was awarded to F. G. Smith on a $3\frac{1}{2}$ h.p. Triumph, whose score was a total of only 2m. 22s. deviation from exact time

at the five special controls. Second place was occupied by H. G. Bell on a similar machine with a total of 3m., and L. A. Baddeley was third with 4m. 42s. It is a remarkable fact that Smith, by winning both the Edinburgh and the Land's End competitions, repeats the performance of S. G. Frost last year.

Gold medals were awarded to the second and third men above named, and also to E. Gwynne, G. Purchase, A. T. Stanton, W. W. Douglas, G. Brough, H. Gibson, W. Cooper, and J. Winslow, silver medals to Stanley Webb, J. V. Robinson, and E. Peppercorn, and a bronze medal to O. L. Summers.

CLUB NEWS.

Newcastle and District M.C.

The above club held its fourth annual two days' reliability trial for the N.S.U. cup on the 1st and 2nd inst.

The route set for the first day was from the club garage, Newcastle, *via* Kelso, Moffat, New Galloway, and Newton Stewart to Stranraer, where a stay was made for the night—distance of 222 miles. The second day the route was from Stranraer, *via* Castle Douglas, Annan, Canobie, Langholm, Hawick, and Jedburgh, to the club garage again—further distance of 204 miles, the total mileage being 426 $\frac{3}{4}$.

At Stranraer there were five competitors standing equal as regards marking, which pointed to a very keen struggle for the premier position. They were G. W. Raper, R. Crosier, R. Ellis, R. B. Smith, and E. L. Bates.

The weather remained fine and dry for the second day's journey, and ten competitors checked into Langholm for dinner, and later at Otterburn for tea, and ultimately at the clubhouse at the finish of the trial.

Winner of N.S.U. cup and special gold medal, presented by Mr. Robson Crosier.—G. W. Raper (6 h.p. N.S.U. twin).

Winner of A.C.U. special medal.—R. Crosier ($3\frac{1}{2}$ h.p. Ariel).

Winner of silver cigarette case, presented by Sir R. K. Arbuthnot, Bart.; R.N., for rider who has not previously won a club prize, doing best performance.—J. J. Hall ($3\frac{1}{2}$ h.p. Triumph).

Winners of club gold medals, riders not losing thirty marks between eight controls, half a minute late or early on schedule time representing loss of one mark.—Robert Ellis ($3\frac{1}{2}$ h.p. Special Rex), R. B. Smith (4 h.p. N.S.U., single), Geo. Dyson ($3\frac{1}{2}$ h.p. Premier), C. Reinhart ($3\frac{1}{2}$ h.p.

N.S.U.), T. Smith ($3\frac{1}{2}$ h.p. Triumph), and E. L. Bates (5 h.p. N.S.U. and sidecar).

Winners of club bronze medals, riders completing the course under forty-eight hours.—J. J. Hall ($3\frac{1}{2}$ h.p. Triumph) and T. W. Hall ($3\frac{1}{2}$ h.p. Bradbury).

Hull A.C.C. Reliability Trial to Whitby and back. Some competitors leaving the Newland control.

Club News.—

Manchester M.C. Reliability Trial.

The results of the above club's reliability trial on the 31st ult. to Dolgelly have been returned as follows: Single-cylinders—1, J. Eastwood (3½ h.p. Bradbury), 897.2 marks; non-trade members' prize, A. Moorhouse (3½ h.p. Triumph), 890 marks, also winning the timed hill-climb on formula. Twin-cylinders—H. Read (5 h.p. Dot), 885 marks; non-trade members' prize, J. Smith (5 h.p. Rex), 790 marks; Eastwood (3½ h.p. Bradbury), made fastest time in the hill-climb *en route*. Maximum number of marks, 900.

Western District M.C. (London).

Owing to the unfavourable weather and greasy condition of the roads on the 24th ult. the annual hill-climb fixed to take place on that date was postponed. It has now been decided by the committee to hold the event on Saturday, August 28th. Separate classes will be arranged as follows: Class 1, lightweights; Class 2, touring machines with single-cylinders of any capacity; Class 3, touring machines with multi-cylinders of any capacity; Class 4, for racing machines, including Tourist Trophy models, Speed Kings, etc. Messrs. I. Babbage and H. J. M. Hughes have been appointed to act as judges. Results will be decided on A.C.U. formula. Entries should reach the hon. secretary, Mr. F. H. Mullett, 53, Kingsley Avenue, West Ealing, W., not later than Monday, the 23rd inst.

Scarborough and District M.C.

On the 2nd inst. the above club held its second annual speed judging trial at Snainton. The competitors had to run over a measured half-mile, first at twelve miles an hour, and then at twenty miles an hour. First prize was won by Mr. Dale, of Middlesbrough, who was only three-fifths of a second out on the 20 m.p.h. test; the second prize was won by Mr. C. Pugh, 10s. out. Mr. V. Topham officiated as timekeeper. After the competition the members adjourned to the New Inn, Snainton, for tea. In the evening Mr. Ringrose, of West Ayton, opened the club quarters in Hibernia Street, which consist of a motor cycle garage with a reading room and library above. An exhibition of excellent lantern slides was given by the secretary.

Leeds M.C.C.

The hill-climbing competition held on Saturday last was originally arranged to be held on Otley, Old Chevin, but one of the residents near by requested the officials to change the venue as his wife was very ill. He very kindly offered to present a cup at some future date for competition. A police sergeant told the officials of another hill, Norwood Edge, and all the competitors rode there—about five miles from Otley. One corner of the hill was found to be very tricky—almost as bad as Sutton Bank. Several competitors sustained falls in negotiating this corner. The results were: 1, G. Mackay; 2, Shaw; 3, A. B. Hughes. Fastest time was made by the trials hon. sec., A. E. Bagshawe.

Next Saturday the annual speed trials will be held at Temple Newsum in conjunction with the Bradford M.C.C.

Falkirk and District M.C.

A hill-climbing contest was held on Preston Hill, near Linlithgow, on the 31st ult. The hill selected has two bad corners, the second of which, known as the "Devil's Elbow," is very sharp, and is immediately followed by a fair gradient. The difficulties in negotiating this second corner were greatly increased by a quantity of loose metal at the corner, which accounted for several of the competitors coming to grief.

After the competition the members adjourned to St. Michael's Hotel, Linlithgow, where they were entertained to tea by the club. The following is a list of the winners and their machines in the order in which they finished.

Class 1—R. Shanks (1½ h.p. F.N.) Class 2—A. H. Alexander (3½ h.p. Rex), D. R. Kelly (3½ h.p. Triumph), and R. H. Salvesen (3½ h.p. Triumph). Class 3—J. A. Une (4½ h.p. F.N.), J. M. Dobson (5 h.p. V.S.), and D. S. Cousins (5 h.p. V.S.) Class 4 (Mitchell Cup)—Winner, R. Shanks (1½ h.p. F.N.). A. B. Blane (1½ h.p. F.N.) Class 5—D. S. Cousins (5 h.p. V.S.), G. Kern (6 h.p. N.S.U.), and J. M. Dobson (5 h.p. V.S.)

D. S. Cousins made the fastest time of the day on his 5 h.p. V.S. It was a fine exhibition of skilful driving, his machine taking him up the hill at a great pace, and picking up after turning the corners in splendid style.

Ulster Centre M.C.U.I.

A hill-climbing competition in connection with this centre took place on the 7th inst. at Magheramorne, Co. Antrim, under the following conditions: Each competitor to make a timed trial ascent of the hill, the difference in the times recorded to represent the handicap, and any rider who in the hill-climb exceeded his trial time by five per cent. was to be considered out of the contest. The timing was done by a new electric apparatus recently acquired by the centre, and this worked without a hitch. The hill proved one of the best ever selected, the surface being good and the corners not too dangerous. Details:

Trial times: J. Stewart (3½ h.p. Triumph), 56s.; F. H. Maclean (3½ h.p. Triumph), 56s.; S. P. Corry (3½ h.p. Triumph), 57s.; J. J. O'Rawe (3½ h.p. Rex), 57½s.; A. V. Blake (3½ h.p. Triumph), 59s.; T. T. Maclean (3½ h.p. Triumph), 60½s.; J. S. Garrett (3½ h.p. Rex), 68½s.

Placings:	Competition time.	Handicap.	Nett time.
1. J. S. Garrett (3½ h.p. Rex)...	66½s.	12½s.	54s.
2. A. V. Blake (3½ h.p. Triumph)...	58½s.	3s.	55½s.
3. S. P. Corry (3½ h.p. Triumph)...	57s.	1s.	56s.
4. F. H. Maclean (3½ h.p. Triumph)...	56½s.	scratch	56½s.
5. T. T. Maclean (3½ h.p. Triumph)...	60½s.	4½s.	56½s.
6. J. J. O'Rawe (3½ h.p. Rex)...	57½s.	1½s.	56½s.
7. J. Stewart (3½ h.p. Triumph)...	57½s.	scratch	57½s.

Officials: Starter, R. G. Lindsay; timekeeper, E. B. Waring; stewards, J. J. Kennedy, R. W. Sloan, L. MacLaine, and H. Denby.

The open 400 miles reliability trials for the Muratti Trophy will take place on Monday and Tuesday, August 30th and 31st. Entry forms and all particulars can be had from the secretary, E. B. Waring, Grand Central Hotel, Belfast.

A police sergeant telling a Leeds M.C.C. official of another hill, the one at Otley, Old Chevin, not being available for reasons stated above.

Competitors in the Leeds M.C.C. annual hill-climbing competition last Saturday photographed at the viaduct over Ludley reservoir.

Club News—

Walthamstow M.C.

The above club held the Yarmouth and back competition on the 17th ult. The course was Walthamstow, Newmarket, Norwich, Acle, Yarmouth, and back; distance, 250 miles.

Out of thirteen starters, nine completed the journey to schedule time, viz.: J. W. Percival (6 h.p. Fafnir tricar), F. W. Applebee (5 h.p. Rex), F. A. Applebee (5 h.p. Rex and sidecar), W. H. Applebee (4½ h.p. Minerva and sidecar), J. H. Kerr (5 h.p. Rex and sidecar), G. Whitter (3½ h.p. Rex), H. Hudson (3½ h.p. Peugeot), W. S. Low (3½ h.p. Rex), and D. Fairhead (3½ h.p. J.A.P. Royal).

On August 28th the competition for Mr. G. West's prize will be held on a circular course of about twelve miles to be covered four times.

Coventry and Warwickshire M.C.

The hon. sec. of the Motor Cycle Hill-climb, W. F. Grew, 19, Hertford Street, Coventry, has received one or two letters regarding the regulations for Class 2, and as there seems to be some doubt with regard to the equipment of machines in this class we are requested to point out to intending competitors that all machines in Class 2 will require to be fitted with exhaust pipes and efficient silencers. Entries at ordinary fees will be accepted up to first post to-morrow (Thursday) and at double fees up to Saturday next first post. Several well-known riders have already entered, and a successful competition is practically assured. We hope to publish a complete list of entrants and their machines in the issue of August 18th. In the meantime intending competitors are asked to send in their entries without delay.

Ayr and District M.C.

The above club brought off a double event on Monday afternoon, the 2nd inst., when twenty-two members took part. The first item consisted of a speed-judging competition, the participants starting from the headquarters of the club and riding to Giltreehill Brae, a distance of seven and a quarter miles, at various speeds ranging from ten to twenty miles an hour, the different speeds being balloted for before starting. The winner was Q. Clark (5 h.p. Rex), who was 1m. 55s. fast.

The second event was a hill-climb on the hill above mentioned, and this proved by far the most interesting and exciting of the three climbs organised by the club this year. The hill, which is over half a mile in length, is extremely steep, and has two right and left-hand bends, on which some of the members came to grief, but, fortunately, without sustaining any serious injury. The result was based on the

Capacity × Gear × Time

formula, $\frac{\text{Weight}}{\text{Capacity} \times \text{Gear} \times \text{Time}}$, and the competitors

Weight

were divided into two classes, the results being as under-noted. -A special prize for the fastest time of the day was won by A. P. Walker on a 5 h.p. Vindec Special.

CLASS I. (all under 520 cc. capacity).

Figure of merit.

- | | |
|--|-------|
| 1. Jas. McClure (3½ h.p. Triumph) ... | 3.6 |
| 2. John Meredith (3½ h.p. Triumph) ... | 11.37 |
| 3. W. Munro (3½ h.p. Brown) ... | 19.2 |

CLASS II. (all over 520 cc. capacity).

- | | |
|---|------|
| 1. A. P. Walker (5 h.p. Vindec Special) ... | X |
| 2. A. Sommerville (5-6 h.p. Roc) ... | 9.1 |
| 3. Q. Clark (5 h.p. Rex) ... | 39.5 |

Southampton and District M.C.

A speed-judging competition held last Wednesday resulted in a win for A. G. Butler, E. Prince being second, and W. Winckworth third.

Bolton and District M.C.C.

The above club will hold its annual hill-climb on Saturday the 21st inst. The hill will not be announced till the day of the competition. This year there will be three classes —(1) single class touring machines, (2) twin touring machines, and (3) single racing class..

J. Eastwood (1909 3½ Bradbury), who made fastest time in the Manchester M.C. hill climb, and also accomplished a non-stop run in the same club's reliability trial. (See below.)

Manchester M.C.

This energetic club held a one day's reliability run on Saturday last. The course mapped out was a most arduous one, made more difficult by the heavy roads and almost incessant rain. The competitors numbered ten motor cyclists and six autocarists, and were despatched from a point close to Manchester shortly after 8 a.m. Rain continued all the way through Chester, Wrexham, Chirk, Oswestry to Llanfyllin, 76½ miles, where engines were stopped for the first time while one hour was allowed for lunch. Then by way of Mallwyd and Dinas Mawddwy to Bwlch Oer-drws, where a hill-climb took place up this famous hill. The surface, generally good, was in a very bad condition, yet three motor cyclists made a clean ascent. J. Eastwood, 3½ h.p. Bradbury, made an absolute non-stop run; he also did fastest time on the hill. Other competitors to get through were A. Moorhouse, 3½ h.p. Triumph; H. Reed, 5 h.p. Dot; and J. Smith, 5 h.p. Rex; the remainder retired. The formula results will be announced later.

THE BIRMINGHAM v. OXFORD M.C.C. INTER-CLUB HILL-CLIMBING COMPETITION.

The winning team of the Birmingham M.C.C.

The Oxford Representatives.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Silence.

[4180.]—I can corroborate all previous letters *re* the Clair silencer. Some three months ago I fitted one of these to my 4 h.p. Bat. and as in Mr. C. Lake's case, my machine is ninety per cent. quieter than formerly. That awful, nerve-destroying, Gatling gun effect is entirely eliminated, and one can now distinctly hear the valves closing. To prove its efficacy one has only to open the cut-out.

I scarcely need add I have no interest in the makers beyond being a

SATISFIED PURCHASER.

[4181.]—Referring to letter 4163 in the issue of the 28th ult., this is a matter of great interest to me. The distinct bark of my 3½ h.p. — is my great bugbear; with less noise my enjoyment would be considerably enhanced. Explanations are, however, wanted to fully understand how this butterfly valve at extreme end of 5 feet of exhaust pipe is operated. Is the valve opening instead of the holes found in all other exhaust boxes?

I should be glad if Mr. Grafton would give us a little more enlightenment, or tell us where this exhaust trap can be purchased.

J. FALLOW.

[4182.]—I have read with interest the recent correspondence on silencers, and have thought that my personal experience might prove of assistance to those who are on the look-out for a really silent exhaust box, giving no back pressure.

I had tried several, including some home-made ones, until recently, when I obtained a St. Denis silencer of suitable size, from United Motor Industries, Ltd., Poland Street, London, and which after ample trials I can thoroughly recommend for absolute silence. The first thing that struck me was the speed I got out of my motor, proving the superiority of the silencer over what I was using as regards back pressure. These silencers are strongly made, and at about the usual price of such articles.

E. RYE.

Cardiganshire Police and Motor Cyclists.

[4183.]—Seeing farther reference being made to "the roads leading to Aberystwyth and the police," I think that if you will permit me to state my case, you will see that the comments in *The Autocar* are not altogether uncalled for.

Last month I was a competitor in a reliability run from Cardiff to Aberystwyth and back in connection with the Cardiff M.C., and during that run, on rounding a corner, about eight miles out on the return journey, I came across a policeman, and was called upon to stop. I was then accused of riding round the corner at the rate of 30 m.p.h., the result being that I was fined £2 and £1 ls. costs, and my licence endorsed, for riding to the danger of the public. Considering the very sharp bend of the road, and the loose surface, my contention is that it was impossible to do anything like 20 m.p.h.; and also, seeing that there was no habitation of any description and not a soul to be met for miles but the policeman, I have yet to learn how I rode to the danger of the public. I may also add that another of our members was timed over a stretch in the same run, proved to be doing 30½ m.p.h., and was only fined £1 and 14s. 6d. costs. Is this called justice?

H. J. RATCH.

Where Improvement is Needed.

[4184.]—It is quite refreshing to read the intelligent views as expressed by Mr. Edgcombe, which I fully endorse as I consider the so-called carbon deposit to be ninety per cent. road dust.

On a recent tour of 887 miles I found, on running from Birmingham to Southampton and taking my cylinder off, a much deposit as I found on reaching Durham from Weybridge—probably more. Hampshire I consider the very worst county for dusty roads.

Two rubber pipes of requisite section for main and auxiliary air, led, as suggested by Mr. Edgcombe, to handle bar *via* frame, would no doubt overcome this bugbear.

For the above reason I always when coasting shut the air right off with petrol full on.

H. P. LEWIS, Captain "Royal Mail."

Sunday Competitions.

[4185.]—I entirely agree with "Anti-Humbug's" letter regarding Sunday competitions. Personally, I am not a competition enthusiast, but I think the A.C.U. is very unreasonable to try to ban any competition that may be held on a Sunday. Every motor cyclist cannot enter competition on a week-day. Personally, I cannot see any difference between a party of motor cyclists going for a run of about 10 miles, and a party holding a reliability trial, speed-judging or a consumption trial. I think that riders in a competition of that description are no more likely to bring the sport into disrepute than a party that is out for a run only.

H. W. BEECH.

[4186.]—"The Wandering Worm" in letter 417 says there is no need for the A.C.U. to speak right out, but when this body passes a resolution condemning Sunday competitions, this ban has a detrimental effect, as instance the paragraph page 452 in June 16th issue which called attention to the "regrettable" action of certain clubmen in the matter.

Again, it places firms or individuals who offer cups or medals in a quandrous position.

Were it not for the Sunday usage of motor cycles some of our largest firms would not be of the magnitude they are, and as pointed out in letter 4154 July 28th issue, by Mr. Wilson-Prosser, Sunday is the only day a large number of motor cyclists get to hold their harmless competitions.

"Wandering Worm" refers to the N.C.U.'s attitude twenty years ago, thus confirming Mr. Wilson-Prosser's reference to the A.C.U.'s attitude as grandmotherly legislation.

The A.C.U. in its duty to the public (referred to by "Wandering Worm") is acting most unfairly to a large section of motor cyclists affiliated to it, to whom it would be better to protect than condemn—the "public" must surely be very grateful to them for their attitude.

Meantime, if "Wandering Worm" is on the committee of the A.C.U., let him propose "that the resolution of the A.C.U. condemning Sunday competitions be rescinded," and we can assure him we shall not taunt him that "even worm can turn."

ANTI-HUMBUG.

Federated Malay States Race Meeting.

[4187.]—On page 403 of the issue of May 26th I was very glad to see an illustration of the competitors in the Ipoh (Perak) Federated Malay States race meeting, held on April 1st last. Will you kindly permit me to say that the gentleman who supplied you with the result of the races has done an injustice to two competitors in the races, and I hope to be allowed to correct the mistake?

Event 1.—This race was won by Mr. Low Hoot Kee on a 3½ h.p. Minerva in 2m. 39s., beating Mr. G. P. Parsons, the next fastest, by ½s.

Event 2, an open handicap with a flying start.—In this race, Mr. D. J. Marquess, on a 3½ h.p. Rex, proved successful, his time being 2m. 38½s., and was awarded the first prize.

I hope you will kindly publish the above in justice to the two competitors.
Perak.

ONE OF THE COMPETITORS.**The Six Days' Trials.**

[4188.]—On looking down the columns of the A.C.U. list of marks last there is one thing that does not in the least surprise me, and that is the number of competitors that suffered accidents, damaged pedals, or footrests. I fully agree with "Vigilant" when he speaks of bringing the motor cycle into disrepute, and it certainly will be so if some of the competitors who were riding in the recent trials will ride in the same manner. I witnessed the riders about 10 miles out of Whitchurch (Cheshire), and one party consisting of three took the corner on the right hand side, very narrowly escaping an accident. I consider they were going from sixteen to twenty miles an hour at a point where it was impossible to see if anything was approaching on account of the high hedge. I myself am very fond of an occasional sprint, but not around a dangerous corner. The only way to counteract this is to ride with greater caution around dangerous parts of the roads, and upon motor cyclists it is incumbent to do so.
J.A.P.

Standard Machines.

[4189.]—Our attention has been drawn to a paragraph appearing in "Lion's" notes under the above heading, and this, if allowed to go unchallenged, is likely to hit the producer of the small makes unfairly.

To explain. Believing the N.L.G. to be possessed of a useful turn of speed, we introduced it at Brooklands. It is now common knowledge that it won the first motor cycle race held there, and has won consistently ever since. Brooklands being a racing track, we naturally entered racing models to compete with racing models.

Our touring models, while embodying the special features which have made for such satisfactory results, so far as speed is concerned, are, of course, equipped in a suitable manner to secure to the rider the maximum of comfort on the road.

It is therefore incorrect for your contributor to base any argument as to the genuineness or otherwise of a machine on the premise which he advances—that he could use one of our racing machines for road competitions. The specifications of our touring and our racing machines are entirely different, and are clearly set out with illustrations in our catalogue.

We have felt this letter necessary in justice to those owners of N.L.G. machines who may desire to enter competitions open to standard touring machines.

THE NORTH LONDON GARAGE.**The Lightweight Question Again.**

[4190.]—I feel it my duty to say a few words in praise of the 1½ h.p. lightweight. I am an amateur owner, and use my Motosacoche daily for my work. I have had it for a year now, and have just returned from a 545 miles tour over all sorts and conditions of roads, including the Peak District, Potteries, and the cobble-paved towns of Lancashire, finishing up along the grand old North Road into London. During the whole time I adjusted the platinum points twice (ignition, accumulator, and coil), this being the only adjustment required. I had no punctures and no belt troubles, though perhaps I should say I freshened up the ends of the belt three or four times. I had to pedal on some hills in the Peak District, but it was altogether the most enjoyable tour, and a credit to the Motosacoche. Needless to say, I am not interested in the trade, but only a satisfied user of a splendid little machine. M. R. C. S.

[4191.]—Your correspondent. "Ex-Lightweight," in *The Motor Cycle* of July 14th last, makes an interesting and not unfair comparison between light and heavy motor bicycles, summing up in favour of the latter.

I am, however, one of those who disagree with him, but do not do so without giving him credit for his opinions. The question turns, of course, upon what one needs. I have ridden motor bicycles from their earliest days, and have tried nearly every type in that period. While admitting that the heavy machines have their good points, I personally am going back to the lighter types, mainly because they are so handy, safe on greasy roads, and remarkably economical. Moreover, it must not be forgotten that lightweight motor bicycles have been remarkably improved of late, the use of a small magneto making them simplicity itself.

I have been riding three different makes of light motor bicycles this season, but most of my experience has been with the 2 h.p. Moto-Réve. As it does not exceed 90 lbs. or so in weight, it is difficult to ask for more in this respect, while the power is ample if one takes the trouble to keep the machine in good order. Certainly mine is sufficient for average needs, as it climbs gradients of one in seven without difficulty, while attaining a good thirty-five miles on the level. What I like, too, about the machine is the gentle turning movement of the engine, owing to its having two cylinders. With a machine of this type there is less temptation to "let her go," which, unfortunately, becomes an expensive proceeding in these days of Swiss stop-watches.

Perhaps the usual disclaimer as to trade interest is unnecessary.
A. J. McKINNEY.

In the last A.C.U. Quarterly Trials C. J. Janssen, a Danish rider, made his debut on a Moto Réve.

[4192.]—It is with great reluctance that I write, on the above question, as I am a lightweight enthusiast myself, but I should not like to make such claims as "AN 863" does. He states he would be pleased to meet any 3½ h.p. machine in a traffic riding test and on a long journey. Well, granted that a lightweight does score in traffic (though I find my heavy-weight perfectly manageable), I would remind him that only a very small fraction of one's riding is done through traffic, and, further, that a fifty miles road scramble would not do any good to the sport or prove the worth or otherwise of a machine.

At present I ride a 3½ h.p. medium weight, and am perfectly satisfied, but if I had the money to buy another machine, the Douglas would be one of the machines I should consider before I made my choice. It will be seen, therefore, that I am perfectly unbiassed.

I am constantly riding in the company of others with high and low-powered machines, and find on the road I can keep up with even the fastest twin, simply because the rider has more power than he wants, on the level. But I know that I should be hopelessly left if he liked to "let her out" a bit. In the same way, I have no doubt a Douglas could keep up a comfortable touring speed in the best of company, but if it came to a question of surmounting freak hills, or seeing who could do the greatest possible distance in the shortest possible time, the lightweight would be sure to be left. It would not be a fair test, 2½ h.p. against 3½ h.p. or 5 h.p.
E. M. OLIVER.

THE ROC - GOLD MEDAL AWARD. and ABSOLUTE RELIABILITY.

SIX DAYS' TRIALS: **GOLD MEDAL** awarded for best performance on privately-owned machine was fitted with the genuine **ROC Clutch and Two Speed Gear Conversion Set.**

SCOTTISH TRIALS:

Northampton, 26th July, 1909.

It is with great pleasure that we testify to the absolute reliability of the Roc clutch and two speed gear used in these trials. It was generally acknowledged that this was the most severe test that has ever been held, and with a 3 h.p. engine to average 20 miles an hour (no time being allowed for stopping at controls) over the worst roads possible to find, it goes without saying that there cannot be any spare time for adjustments, in fact, not a single adjustment of any kind whatever was necessary, except to straighten a footrest which became bent owing to a bad fall.

THE ADVANCE MOTOR MANUFACTURING CO., LTD.

Both above results were accomplished on ROC Standard Conversion Sets. These sets are now adaptable to ANY make of machine. Time for fitting only occupies a few days. The new ball bearing arrangement is the finishing touch to the greatest improvement ever added to the motor cycle.

Write for booklets of—

- (1) ROC Military Models : 4 h.p. Single Cylinder ; 5-6 h.p. Twin Cylinder.
- (2) ROC Clutch and Gear Conversion Sets, with live axle hand starting.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle" Office. When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be forwarded for replies. Only the number will appear on the advertisement. Replies should be addressed, "P.O., c/o 'The Motor Cycle,' Coventry"; or if "London," added to the address, then to the number given, "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown parties may deal in perfect safety by availing themselves of the Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt, upon intimation of the arrival and acceptance of goods, the money is forwarded less a charge of 1s. registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. Deposit matters are dealt with at Coventry, and cheques and money orders should be made payable to Liffesons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive answer to their enquiries are requested to regard silence as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to them by post.

MOTOR BICYCLES FOR SALE

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

14 h.p. Motosacoche, perfect order; cheap.—J. Weall, Denwick, Alnwick.

44 h.p. 4-cyl. F.N., magneto, perfect, 1907; £22.—Pickering, Hart Rd., West Hartlepool.

TRIUMPH, 1908, perfect condition, Dunlop tires (new). Premier searchlight; £36.—J. Morley, London Sq., Whitley Bay.

1909 Bradbury, 3½ h.p., new June, only done 100 miles, all accessories; illness reason selling; £20.—Whitehall Terrace, Sunderland.

SECTION II.

York and Lancashire.

1908 Triumph, in grand condition; £33.—C. J. Rotherham, Rotherham.

1907 Triumph, handle-bar control; £25, complete.—Cross, Rotherham, Rotherham.

DOUGLAS, Lincoln, Elk, Norton, and Ariel motorcycles in stock.—Gourlay, Fallowfield.

3½ h.p. Riley, fine motor cycle, £15; also smart tractor £2 10s.—20, Potternewton Lane, Leeds.

7-8 h.p. Minerva, 1908, will take sidecar anywhere; perfect order, spares; £30.—14, Fir St., Sheffield.

1909 Rex, 3½ h.p., new; quick sale, accept £29, gain; no offers.—Cochrane, Victoria Bridge, Manchester.

DOUGLAS, 1909, 2½ h.p., twin-cyl., new, ridden 100 miles only; take £26.—Cochrane, Victoria Bridge, Manchester.

2½ h.p. Kerry, new tyre and accumulator, 26 by 2, 24 grey, fast; for cash, £10.—Barker, Aldborough, Darlington.

TRIUMPH, 1909, like new, Cowey's speedometer, lamp, and all spares; £40.—Smith, 108, Hodge St., Sheffield.

REX, late 1908, Tourist, ball bearing engine, perfect; reasonable offer wanted.—Write, 39, Bedford Rd., Southport.

2 h.p. Minerva, Barlow carburetter, copper tank, spring forks, low, French grey; £9.—Hall St., Southport.

REX, 3½ h.p., 1908 (new), Amac H.B. control; offer or exchange Triumph or twin Vindec.—S. L. H. shall, Knaresborough.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

THE TOURIST TROPHY RACE FUND.

AS announced in the last issue, the International T.T. Motor Cycle Race is to be held in the Isle of Man on Thursday, September 23rd, and will, we hope, be a most successful event.

Readers will recollect that last year when the race was held the Royal Automobile Club held a car race about the same time. This resulted in the committee of the Auto Cycle Union being saved a considerable amount of expense in organisation. This year, however, there will be no car race; consequently, all the cost of organisation will fall upon the A.C.U., and the committee therefore respectfully invite all who are interested in motor cycling to subscribe towards a fund for defraying the expenses incurred in connection with the preparation of the course, conveying officials to the Isle of Man, and the sundry expenses which are unavoidable in the conduct and organisation of an important event like the Tourist Trophy Race. Last year *The Motor Cycle*, at the suggestion of the secretary of the A.C.U., Mr. F. Straight, opened a subscription sheet for motor cyclists, which was called the Tourist Trophy Shilling Fund. This was fairly successful, but nothing like so successful as it might have been. This year we hope that those interested in motor cycling, such as secretaries of clubs, will write to the A.C.U., 18, Down Street, Piccadilly, W.; for a subscription sheet. In addition to publishing the total amounts collected by hon. secretaries of motor cycling organisations, *pour encourager les autres*, *The Motor Cycle* will contribute 1s. for every £1 up to £100 sent in by club secretaries or others. Contributions should be addressed to *The Motor Cycle*, Coventry, before the date of the competition, the 23rd

prox. Readers who send for these collecting sheets should bear in mind that the T.T. Race is a competition promoted in the best interests of the pastime and with a view to improving motor cycles in general. Had there been no T.T. Races probably readers would not be riding such efficient motor cycles as they are doing now. Therefore, while collecting the nimble shillings for the fund, they are helping indirectly towards the production of the ideal motor cycle, and not, as many think, assisting manufacturers and the Club to hold a race for their own particular gain and glory. The two previous Tourist Trophy Races in the Isle of Man have been very sporting, and we hope the event will always remain so.

Motor car manufacturers, by assisting the Tourist Trophy Fund, will in reality be helping themselves, because the more motor cyclists there are in the country the more autocarists there will eventually be, for the simple reason that a motor cyclist is usually in his first stage of automobilism, and does not always remain a rider of a single track machine. In course of time many motor cyclists accumulate wealth, or rather sufficient of it to become ambitious enough to purchase a motor car, and it is quite reasonable to suppose that had they not adopted the pastime of motor cycling in the first instance they might never have become motorists at all. Car manufacturers would, therefore, not only assist the A.C.U. by subscribing, but, indirectly, help themselves. One or two car manufacturers we know see eye to eye with us, and have already done a considerable amount of work in the way of assisting motor cycle competitions of all kinds. Would there were many more such.

THE 5-6 h.p. A.C. TRICAR.

AMONG those people who are of the opinion that the tricar is not dead are Auto-Carriers, Ltd., Martell Road, West Norwood, S.E. Since we last described the interesting little vehicle, for the production of which they are responsible, their works have been considerably extended and the vehicle itself has undergone a good many improvements. The engine is now fitted with magneto ignition as a standard, the magneto being placed behind the engine and driven by means of a chain, which is placed in a protected position. By undoing one bolt the tension

The A.C. Carburettor disassembled. The letters are referred to in the accompanying article.

of this chain can be altered. The carburettor, designed by Mr. John Weller, the designer of the Weller car which created a considerable amount of comment a few years ago, also calls for special attention.

Referring to the accompanying illustration, the complete carburettor is represented by A, and it will be seen that the upper portion B is attached to the lower portion, or float chamber C, by means of wing nuts. When the wing nuts are removed and the carburettor dismantled, all the parts fall out into the rider's hand, therefore nothing more accessible can be imagined. The throttle D is of the sleeve variety, and to detach it from the upper portion of the carburettor B it is only necessary to remove the set-screw G. In the lower part of the carburettor the choke tube E is inserted. This is a driving fit, and consequently its

position relative to the sleeve D can easily be altered. The float F is an annular one. The needle I reposes in a recess provided for that purpose in the outer casing of the float chamber, while the Y-shaped fitting H, which serves as a balancing arrangement, merely rests at the bottom of the carburettor with a needle between the fork at the end. The level of the petrol can be altered by an ingenious device consisting simply of a screw in which is the valve seating, which reposes immediately above the petrol union. The carburettor works extremely well, and, being controlled by one lever, is of the simplest type possible.

These are the chief alterations in the A.C. tricar, and, after going through its mechanical details, we were taken for a short run in this interesting little vehicle. It runs very silently, is comfortable, has a large steering lock,

and is decidedly a good hill-climber. It was first of all taken up College Road to the level of the Crystal Palace, which it ascended almost entirely on the top speed. It was then put at Jasper Hill, gradient 1 in 5, which it surmounted on the low gear without any sign of a falter. That the A.C. tricar is a practical touring vehicle we are quite confident. Though the engine is air-cooled, the excellent fan-cooling system works admirably. Many of our readers may not be aware that the A.C. tricar is very largely used for commercial purposes. Machines of this type are driven about London by inexperienced youths, and the reports of their running are excellent. The non-stop performances of the three A.C. tricars in the last Quarterly Trial constitutes a record.

The latest pattern A.C. tiller-steered tricar. The two illustrations serve to show how easily the pleasure pattern tricar can be transformed into a three-wheeled runabout with luggage-carrier at the front.

Views of Hereford Cathedral & the River Wye.

Touring with a Sidecar.

A bad skid was experienced soon after leaving, owing to a kind and considerate market gardener refusing to keep to his correct side of the road, compelling me to apply brakes sharply to avoid a collision, but fortunately no damage was done.

We spun merrily along through Bramber and Steyn- ing, and near Petworth encountered a herd of bullocks, which gave us rather an exciting time, being very difficult to pass, but after this incident we quickly made Petersfield, Botley, and Southampton, and crossed Red Bridge into the New Forest, through which we had a delightful run, arriving at Bournemouth at 7.30. After spending a day or so amongst these lovely surroundings, a start was made for South Devon on the following Wednesday morning at 9 o'clock. Rain greeted us at Wimborne, but only proved to be a shower, and we continued our way to Blandford and Sherborne, where petrol was taken in. A prophet had warned me that the hills between Yeovil and Honiton would give me a trying time, but, thanks to my excellent low gear, I experienced no trouble whatever in surmounting them with passenger aboard, although the climbs out of Crewkerne, Yarcombe, and Chard I found to be tough customers. At the summit of one hill I noticed a small hostel called the Windwhistle Inn—a name that struck me as most appropriate, as unfortunately we had been

TOURING with a sidecar is fine sport! I had made up my mind to dispense with the services of the railway company for my 1909 holiday, being the possessor of a 1909 5 h.p. two-speed geared twin Vindex motor bicycle and a Mills-Fulford castor wheel sidecar. My experiment was a great success, and will undoubtedly be repeated. A packed railway carriage on a broiling hot day is not exactly the most ideal mode of travel. As it is necessary to take a considerable amount of luggage when one has a lady passenger, this was my first consideration, and in order to minimise weight I had a box constructed of flaxite, a light fibre material as used for the manufacture of dress trunks, which, with three coats of paint and one of varnish, has proved to be all one could desire, and moreover fairly inexpensive. This was securely bolted at the rear of the sidecar to tubes attached to the base as per illustration, and, in order to carry a spare supply of petrol and lubricant, a board was clipped to the sidecar frame underneath the seat, to which a tin box was secured, just large enough to take a half-gallon can of petrol and a quart of lubricating oil. I was more than once thankful for carrying the latter when I found my oil tank empty amongst the Somerset hills and several miles from a town. A half-plate camera was securely packed with its full complement of slides in the case fixed to luggage-carrier, the stand being strapped to the inside tube of sidecar, a couple of spare inner tubes and a cover completing the outfit.

A Hill at Lewes causes a Stop.

Everything being in apparent good order, my wife and I left Eastbourne at 6.30 one fine morning last month, but trouble commenced early, as for some unaccountable reason the machine was not pulling at all well on the hills, and much to my surprise refused to climb School Hill, Lewes, on the low gear (9 to 1), although the engine appeared to be firing perfectly. As matters did not improve, a stop was made at a Hove garage, where it was found that the back hub was excessively hot, and after breakfast had been discussed the rear wheel was removed from the frame and the trouble quickly found, as the cones had tightened themselves and made the axle practically a fixture. In fairness to the machine, I think I should add that this was probably caused by towing a heavy broken-down tricar and passengers a distance of nine miles the previous week-end. The wheel was soon replaced, and after adjusting the low speed, which had been slipping slightly, we left Hove at 1.30 in better spirits, hoping to reach Bournemouth before nightfall.

The writer with his V.S. sidecar combination.

bothered with a strong headwind, and to hear it whistling and screeching through the trees at this spot was most uncanny. We were not long in reaching Honiton, and the ever faithful city of Exeter was passed through at 3.15. Our next stop was Dawlish, where we were glad of a cup of tea and a short rest. There is a steep climb out of this town and a bad descent into Teignmouth, but journeying *via* Newton Abbot we reached our destination—Marldon, a small village near Torquay—at 6 o'clock.

Touring with a Sidecar.—

Here we spent an enjoyable week, the steep hills and narrow winding lanes and bad road surfaces thoroughly testing machine, sidecar, and gear. I might here mention that, curious as it may seem, at each place I stopped in Devon to replenish the petrol tank a measure was an unknown thing, and one young mechanic at Honiton informed me that "Us always measures it near enuff with a stick." I do not suggest that all garages in Devon act in the same easy-going fashion, but can vouch for the fact that I saw it used at three in different parts of the county.

The return journey was commenced in fine weather, and with the machine running as well as ever we left

Equipped for the tour.

Marldon at 6.30 in the morning, experiencing a delightful ride over Little Haldon into Exeter, Honiton being reached at 8.20. Here we halted for breakfast,

or at least a second one, leaving well satisfied with the Dolphin Hotel, where we were served both quickly and well. After Honiton we were again amongst the hills, but had a capital non-stop run through to Sherborne, where petrol was taken aboard. Bournemouth was reached at 2.45 after a really excellent run of 125 miles.

The Last Stage of the Tour.

We spent a couple of days at Bournemouth, continuing our way home on the morning of the third day. We sped through the New Forest, and soon found ourselves at Petersfield. The scenery onwards to Steyning is particularly fine, and I was tempted to make several stops to expose a plate. The surroundings of Midhurst and Stopham are especially attractive. We arrived in Brighton before three, and here met a friend, who accompanied us the remainder of our journey to Eastbourne, where we halted at 4.30 after a no trouble run. My wife and I voted it the best and cheapest holiday we ever spent, and I have nothing but praise for the machine, gear, and sidecar. Our tyre troubles were nil, so I may be permitted to mention the equipment. The front wheel and sidecar were shod with ordinary Peter Union covers, which have not punctured once in 2,500 miles, and show but little wear. The back tyre is a Michelin non-skid light car tyre (650 by 65 mm.), which completed 800 miles without trouble, and it is the only tyre that I have yet found to stand the strain of a 5 h.p. engine and sidecar. The 1in. Stanley Dermatine belt was also faultless. In conclusion, I can most thoroughly recommend the Vindec-Mills-Fulford combination to anyone requiring a reliable and speedy sidecar outfit, and wish to add that I am in no way interested in any one of the products mentioned, but my experience may be of service to others, as I well remember the troubles I had with another passenger outfit in my novitiate.

ERNEST U. REDWAY.

THE BRITISH MOTOR CYCLE RACING CLUB.

THE fifth of the successful series of racing events held by the British Motor Cycle Racing Club will take place to-day (Wednesday, August 18th) on the Brooklands Track at 3 p.m. As the competition season is drawing to a close, two important events only will figure on the programme. These are:

1. RECORD TIME TRIALS.—Distances, one kilometre and one mile. Flying start. Each member will be allowed one trial over the above-mentioned distances, and best performances will be noted for the under-mentioned engine sizes: Class A, for engines not exceeding 275 c.c. Class B, for engines not exceeding 344 c.c. Class C, for engines not exceeding 500 c.c. Class D, for engines not exceeding 750 c.c. Class E, for engines not exceeding 1,000 c.c. Certificates officially certifying the best performance made in each of the above classes will be given. The Club gold medal will be awarded in each class for the best aggregate performances made during the season at these meetings. In the event of world's record being established, a Brooklands' certificate will be issued.

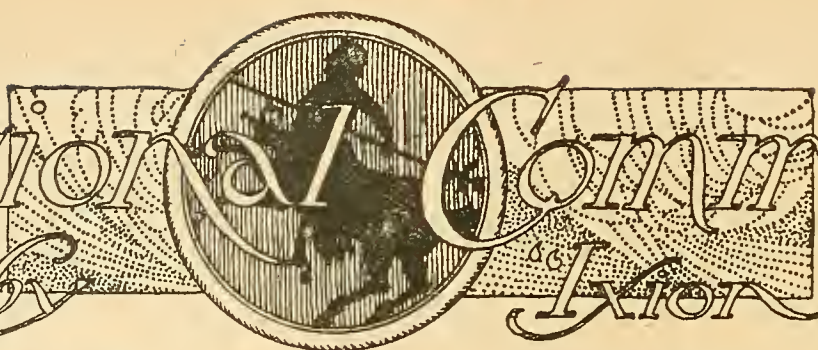

2. ONE HOUR'S RACE.—Four classes. Class B, machines with engines not exceeding (lightweight not exceeding 110 lbs.) 344 c.c. Class C, machines with

engines not exceeding 500 c.c. Class D, machines with engines not exceeding 750 c.c. Class E, machines with engines not exceeding 1,000 cc. First prize in Classes C, D, and E, a silver cup each, presented by Messrs. A. G. Forster, W. Krause, and W. H. Wells. Class B (lightweights), silver cup presented by Mr. A. J. Wilson. Second and third prizes, silver medals. Certificates to all finishing the ride recording distance. Five starters in each class to be the minimum for a cup to be awarded.

It is proposed to hold on Saturday afternoon, October 9th, at 3 p.m., a two hours' record race for all classes, giving members an opportunity of putting up performances of fifty miles, 100 miles, and two hours. The distances and times are as follows: Fifty miles, 53m. 20s.; 100 miles, 1h. 56m. 17s.; two hours, 103 miles 280 yards. Silver cups for the best performances in each class, and silver medals for standard time and distance will be awarded.

Motor cyclists who have been experiencing belt troubles should write to the Continental Tyre Co., Clerkenwell Road, E.C., who will be pleased to send gratis a section of their new motor cycle belt.

Occasional Comment

A Case of Overhauling.

An illuminating sample of the obstacles which beset the path of the epistolary diagnosis came under my notice this week. A rider asked me to look at his machine, informing me that it was running badly, and that he fancied the carburetter was flooding a little, but that otherwise everything was A1. When we set about the machine in company, I found ample explanation of bad running. The choke tube of the Longuemare carburetter had been lost, and the vaporiser reassembled without it, so that the engine was receiving a huge excess of extra air. The magneto contact breaker was full of small brass filings, and investigation proved that a small screw in the contact breaker had been broken, and that its base was ploughing up the face of the end-plate of the armature. The crankshaft was so badly out of truth that the flywheels were rubbing against the side of the crank case, which explained the enormous compression in which the owner had rejoiced. The magneto chain had an enormous amount of backlash. When we are in a position to reassemble the machine, I daresay other minor derangements will be brought to light, but I have said sufficient to show that no newspaper adviser is necessarily to blame when he fails to cure a complicated case of trouble by letter post. I may add that the machine in question is a very old one, which has been badly handled by colonial repairers.

Smash-proof Brakes.

I wonder how many motor bicycles go through a year without a tumble? I am not speaking exclusively of sideslips and collisions, but include every form of fall, including blowing over when on the stand and being dropped during careless handling. I fancy very few machines attain their first birthday without a fall of some sort. When we look at the machines of to-day, we notice that most of them are provided with footrests, which, by reason of their protruding position, take the brunt of every fall. So far so good. We notice also that the better of the two brakes (the back belt rim shoe brake) is almost invariably mounted on one of these footrests, and mounted in such a way that a bent or broken footrest deprives the rider of his main brake. These things ought not so to be. It is good to save vital portions of the mechanism by protruding footrests, but it is distinctly bad when a bent or broken footrest leaves the rider with but a single brake, and that brake fitted to comply with an obsolete law, and being itself useless to all intents and purposes. The foot brake, at any rate, ought to be so made and fitted that only a very bad smash indeed could disorganise its working. The same applies to the control of many variable gears and free engines. I saw a machine last week which had been rendered absolutely unrideable by a very insignificant tumble indeed. All that had

happened was that a flat-footed stand had been let down on an uneven road, and the machine had toppled over when the rider brushed against it in lighting his pipe. But as it happened the footrests carried a rather flimsy and complicated control set for the operation of a two-speed gear and free engine, with the result that the machine could not be driven on either gear, and had to be shamefully carried to its destination in the guard's van. Bad design, gentlemen! We want more makers who ride. Or, if I were in the trade, I should be rather inclined to pay a high salary to the biggest duffer of a motor cyclist I could find amongst my customers to ride one of my machines in all weathers, and see how many weak points his driving and treatment could discover in it.

Dust-excluding Carburetters.

With the knowledge that dust has a good deal to do with carbon deposits, several correspondents have written me on the subject of dust-excluding carburetters. Gauze protection is, after all, only a makeshift, and not very satisfactory at that. It certainly excludes dust, if it is of fine mesh, but the air apertures have to be enlarged in area to atone for the obstructing wires, and the gauze holds the dust it arrests, and needs very frequent wiping down with a brush or rag dipped in petrol. A carburetter may be protected from choked jet or jammed slides simply by a wise choice of its position on the machine. The real need for protection arises from the rapidity with which road dust enters the engines, pits the valves, grinds the piston rings, and is deposited in carbonised incrustations on the cylinder head. These mishaps occur no matter where the carburetter is set, and, owing to them, there is a need and a demand for a protected carburetter. Werner Frères and the Rex Co. tried to solve the problem years ago by putting their carburetter inside the tank; the idea was good, as the air orifices could be placed in a very sheltered situation indeed, but it has since been discarded, and the devices were highly inaccessible. I believe the correspondent who suggested on page 554 that a pipe be carried neatly out of sight from the air intake to the centre of the handle-bars was on the right lines. A funnel or airscoop could be quite unostentatiously fitted in some such fashion as this, and would only collect "dusty air" when riding in the wake of some other dust-raising motor. I heard an amusing retort on this point last week. A motor cyclist complained to the makers of his carburetter that it would not work when full of dirt. They replied that it could not construct a carburetter that would work when full of dirt. He replied that this was not what he wanted; he would be quite content with a carburetter which could never under any circumstances get full of dirt! There is a thought in that. [Why not use the large diameter frame tubes to convey the air?—Ed.]

QUESTIONS

AND REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor St., E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Clutch Slipping on Steep Hills.

?

I have a Mabon clutch on my 3 h.p. Triumph. This slips badly on steep hills. I have tightened it up by the spring, and have regulated the oil supply. What should I do now? What oil should be used?—J. P. W.

You are evidently oiling the clutch excessively. If you inject too much oil, or if the oil is too thick, the clutch will not grip on steep hills, and the remedy is to clean it out with paraffin. Often it is only necessary to inject a small quantity of paraffin to thin the oil and cure the slipping.

Avoiding Police Traps.

?

Kindly let me know the best way to get from Ealing to Derby. I do not wish to go through Warwickshire, or any district infested with police traps. I was thinking of going through St. Albans. Which is the best way to St. Albans from Ealing? Would you kindly let me know of any police traps there may be on the route you suggest from Ealing to Derby?—R.W.

We suggest the following route: Ealing, Harrow, Bushey Heath, Elstree, St. Albans, Luton, Bedford, Higham Ferrers, Kettering, Market Harborough, Leicester, Loughborough, and Derby. We do not know of any police traps on this route.

Carbon Deposit causes Pre-ignition.

?

I have used a 1908 3½ h.p. N.S.U. and sidecar for 1,500 miles. Lately it has started backfiring. It runs about 500 yards, then stops, the engine backfiring of its own accord. I have had the machine examined at a garage, but the people could not find the cause. They have fitted a new Bosch plug, but there is very little improvement. They say the magneto is working correctly and the carburetter in good order. What can possibly be wrong? Even after stopping there is no trouble in starting. I am eagerly awaiting your opinion.—C. D. J.

All we can suggest is that the cylinder head and piston are covered with carbon deposit, which becomes incandescent after the engine has been running some time, and thus causes excessive pre-ignition. If cleaning the cylinder and piston does not effect a cure, as we imagine, have your magneto carefully overhauled to see that the cam and contact-breaker mechanism are not excessively worn.

A Variable Gear for a Pedalless Machine.

?

Would you kindly let me know whether there is on the market a variable pulley which automatically adjusts itself to the load, within limits, that would prove a useful and satisfactory fitting on my 1908 Triumph. I am in the habit of riding my machine fitted up so as to get maximum comfort out of it. The pedal gear I have completely removed and replaced with spring footboards, and I often carry travelling kit on the carrier. With a gear of 4½ to 1 I get on excellently, although this does not give me much margin on hills of 1 in 7, which I occasionally come across in the Bath district. My weight is about eleven stones.—C.S.

An automatically variable engine pulley is made by the Lloyd Motor Engineering Co., 132, Monument Road, Birmingham. This device we proved to be quite satisfactory on the occasion of a trial some months ago.

Putting a Motor Cycle out of Action.

?

I notice in a recent issue of *The Motor Cycle* an account of a machine being stolen out of a shed at the back of the owner's house. I have made arrangements for keeping mine in a locked-up shed in an hotel yard, and to guard against any such theft as mentioned above, could you suggest any precaution? Of course, anything done to the machine that is universal would be useless. Could you or the Bosch Co. tell me of anything I could do to the magneto to put the same out of order, something simple? Or would it be possible to obstruct in some way the flow of petrol to the carburetter, say by a small screw in some way that of course would have to be taken out every time the machine was required for use?—F.H.

Of course, the best thing you can do is to insure the machine against theft. You can easily put the magneto out of action by connecting the switch screw by means of a fine wire to the spring holding on the brass cover. You can easily arrange this so that it could hardly be noticed. There are many other more obvious methods of putting the machine out of action, such as taking the wire off the high tension terminal, or if you use a detachable fastener, why not remove the belt altogether from the machine each time you have finished with it?

Pedal Starting. Sidecars.

?

I have a 3½ h.p. Triumph, but do not appreciate running alongside it and then jumping into the saddle. (1.) Would it be possible to start the bicycle while sitting in the saddle if I had a Roc clutch, Mabon clutch, or a Gradua gear fitted? Which is the best? (2.) I am thinking of getting a sidecar. Would a two-speed gear be necessary to take about 25 stones? (3.) Is the Lowen sidecar better than the Montgomery? Having two wheels do you not think the former less liable to skid? Would a sidecar necessitate a car licence?—P.G.

(1.) None of the devices mentioned allow of pedal starting while back wheel rests on the ground. The Nala, V.S., and N.S.U. permit of pedal starting. (2.) A two-speed gear would be necessary to get any real pleasure out of the machine in a hilly district. (3.) Whether you have a one or two-wheeled sidecar is a matter of personal choice. Both are good, but we may mention that a rigid pattern sidecar will not skid. No extra licence is required for a sidecar unless you use a two-wheel one, which will convert your machine into a four-wheeled vehicle.

Weak on Hills.

?

I have a 3 h.p. Bradbury with Longuemare carburetter. The machine has good compression, and goes well on the level, but will not climb hills as it pulls up. The plug also gets sooted up quickly. The engine runs best with the air lever wide open and the throttle fully open, but if I attempt to close the throttle a little the engine slows down directly. Can you please give me some tips?—B.W.P.

It looks very much as if the flow of petrol to the carburetter is partially obstructed, or may be some foreign matter has got into the carburetter. If you take off the feed pipe and dismantle the carburetter you will be able to verify this. When the carburetter is clean if the engine fails on hills it may be due to you using too high a gear, or to wrong manipulation of the control levers. If you partly close the throttle without closing the air lever also, naturally the engine will stop. On hills try closing the air lever gradually immediately you notice the engine slowing down. This will enrich the mixture and enable the engine to pull better.

Magneto Ignition.

Q (1.) I have a Fulmina magneto, which has been in use for two seasons and given great satisfaction. But I think the spark is not so "vicious" as it once was, and, although there is a lot of magnetism about, I think it possible that it would be an improvement to get the magnets remagnetised. Does the lessening of spark point to this want? (2.) Also can you explain to me why the position of armature which produces a spark with the least movement of the armature is not the position of maximum spark? That is, in the former position, and when the wheel of armature is turned ever so slightly, a spark is produced at the plug. But in this position if the armature is revolved as rapidly as possible, the spark will only jump about $\frac{1}{8}$ in. Retard from this position about $\frac{1}{8}$ in., and the spark will jump a gap of about $\frac{1}{4}$ in., but has to be moved twice as fast to produce a spark at all at the plug.—S. B.

1.) Gradual lessening of the spark seems to indicate that the magnets will soon require to be remagnetised. (2.) The magnetic field is distorted while the armature is in motion. At the extreme limit of range the spark tends to become weak, and the distortion is such as to move the point on which the maximum electrical effect can be obtained in a backward direction; consequently it is quite possible that there is one point at which the $\frac{1}{8}$ in. spark can be produced with very slight movement, whereas there is another point further back at which a much stronger spark will be obtained, but only when more rapid rotation is given to the armature. For a detailed explanation we refer you to "Motor Cycles and How to Manage Them."

Improving an Old Pattern Machine.

Q (1.) I have a Raleigh with 3 h.p. Fafnir engine, which is running very well, but is not too comfortable on rough roads. Would you advise me to have the engine fitted on to another frame in order to get the extra comfort when riding? If so, what frame would you suggest? (2.) There is, I think, a slight leakage of compression by the large nut, which connects induction pipe to engine. After running for some time I notice quite a quantity of oil on the outside of the nut. This seems as if there is leakage of oil past the piston rings. If, when I examine the rings, I find them bright all round, may I presume that rings are all right? (3.) The inlet valve is ground well in, both surfaces being bright and clean. There is an asbestos washer on the underside of the valve seating, but not one above where the nut holds the inlet valve down. Should there be one in this latter place? If so, what kind? What tension should the spring on the inlet valve be, and how should it be tested? My inlet valve, when spring is fully compressed, opens a good deal more than $\frac{3}{16}$ in.; is this right?—C. R.

(1.) A new modern frame of low design, with spring forks, would make

things much more comfortable for you. We suggest the Chater Lea frame, and should advise you to correspond with the Chater Lea Manufacturing Co., Ltd., 116, Golden Lane, E.C. (2.) Perhaps you are oiling a little too freely. Probably if you fit a copper and asbestos washer at the top of the inlet valve, the leakage will cease. If the rings are bright all round, you may be quite sure that they are satisfactory. Even if they are a good fit when the engine is excessively oiled, the lubricant will sometimes get past the rings. (3.) There is no fixed rule for the strength of the inlet valve spring, but the makers of the engine would supply you with a spring most suitable. Likewise, the correct opening of the inlet valve can only be determined by experiment. $\frac{3}{16}$ in. is too much for a fast running engine, and you would most likely obtain much better results with a $\frac{1}{8}$ in. opening.

A Loss of Power on Hills.

Q I have a 3 h.p. (Birmingham) Quadrant, surface carburetter and accumulator ignition. On a level road the machine runs well at a moderate speed (eight to twelve miles per hour) with spark lever advanced halfway, throttle open a little, and air lever just open. For

Like a penny in a cheese! The inlet valve head of a reader's machine having snapped off, fell into the cylinder, and was jammed through the piston on the upward stroke. This is an old trouble, but latter day engines usually have a stop to prevent the valve head entering the cylinder in case of breakage. We regret to have to admit however, that there is a modern appearance about the piston illustrated.

quite a slight incline I have to give more gas and more air and advance the spark, or the engine slows down. But for a steep hill, even quite a short one, full throttle and corresponding air generally fail to take me up without pedalling, i.e., the engine seems to lose power and sometimes stops quite suddenly or begins to misfire. Similarly on the level, if I advance the spark fully, for speed, it generally misfires in the same way. I have cleaned out the carburetter and enlarged the air inlet to same, so as to facilitate vaporising, and I have fitted a variable pulley

(L.M.C. Auto-varia) to improve hill-climbing, but there still seems to be this loss of power. The cylinder and piston are in perfect condition, and the compression is as good as one could wish for, so the loss is not there. Is it that my weight—14 stones or a little over—is too much for a 3 h.p. engine, or is there anything wrong with the adjustments? The engine generally starts quite easily, even when cold, by running a few yards, with spark lever advanced halfway, but will not start firing at all if the spark lever is put back, as usually recommended. I never have any trouble with premature ignition or backfire, even when the engine is hot.—G. A.

If you have a surface carburetter we ascribe some of your trouble to this. The surface carburetter being designed to work with a lighter spirit than is now sold to the public, it may be necessary to let a little fresh spirit into the carburetter from the tank every time you want to start or restart. Another thing you might turn your attention to is the adjustment of the contact-breaker. Note whether the cam or any of the parts are worn. The fact that the engine misfires at speed and runs regularly at slow speeds seems to indicate that the contact points should be adjusted closer together. Bear in mind that the tension of the valve springs and the correct opening of the valves are important.

Tyres on Lightweights.

Q Will you kindly say if you consider the $1\frac{1}{2}$ in. tyre, fitted generally to lightweight cycles, big enough for rough roads, or would you recommend 2 in. for greater comfort, and, if so, is there any counterbalancing disadvantage? Will the $1\frac{1}{2}$ in. rim of, say, the Moto-sacoché take a 2 in. tyre? Would a spring seat-pillar be a better device for rough roads, or do you think either necessary.—W. B. L.

For greater comfort and extra reliability we should recommend a 2 in. tyre. The only disadvantage is a slightly increased liability to side-slip and slightly reduced speed. Probably a 2 in. tyre will not fit $1\frac{1}{2}$ in. rims; it depends on the make of tyre, so we suggest you write the makers of the tyre you refer to. A spring seat-pillar with a large size spring saddle would, of course, be of advantage.

READERS' REPLIES.**Misfiring at High Speeds.**

Regarding "S. N.'s" enquiry, page 582, when the engine seems to trip itself up at the higher speeds, especially downhill, it is usually due to weak valve springs. A washer about $\frac{1}{16}$ in. thick, tried first on exhaust and then on the m.o. inlet valve, to pack up and stiffen the springs, often works wonders.—J. M. OLIVER.

The 1d. Edition of "The Autocar."

Readers of "The Motor Cycle" who are interested in motor cars are reminded that a Penny Edition of "The Autocar" is now obtainable of all Newsagents and Booksellers every Friday Morning, in addition to the 3d. issue.

'What's in a frame?'

So far as a motor cycle is concerned, and particularly a lightweight, we can truthfully answer—**EVERYTHING!** Instance the case of the

MOTO LUXURIOUS REVE

The frame, illustrated above, has been specially designed to secure strength, rigidity, and lightness. Strength—for safety's sake; Rigidity—to ensure that none of the power of the twin engine is lost in transmission. Low saddle position and ample space for a large tank are also obtained by this registered design. Finally, note the correct position of the adjustable footrests, low engine position and neatness.

May we offer you a trial run? Full details free on request.

Muswell Hill, N.
The B.F. Goodrich Co., 14/6/09
London

Dear Sirs,—No doubt you will be pleased to hear that I was successful in the Plymouth-London and back Trials, and that the pair of tyres supplied by you have proved satisfactory in every way.

They show practically no signs of wear, though they have run close on 1,000 miles; also their stability on greasy roads is marvellous.

The machine I rode was a 5 h.p. twin Rex, two speed model—total weight of myself and machine, 302 lbs.

I hope shortly to be competing in the Six Days' Trials, when I shall use the same pair of tyres, and hope to be as successful as I was in the London-Plymouth.

Yours faithfully
(Signed)
E. O'HAGAN

THE TOURIST TROPHY RACE FUND.

INTERESTING PASSENGER MACHINES.
(ILLUSTRATED).**A Frame Missing.**

On the 8th inst. the shop of J. Horner and Co., 21, Store Street, Tottenham Court Road, W.C., was entered and a new 1909 $3\frac{1}{2}$ h.p. Rex de Luxe motor cycle frame. No. 20398 removed. The above firm will be glad of information which will lead to its recovery.

Six Days' Trial.

The A.C.U. Committee has sent a donation to the Stafford Infirmary as a slight recognition of assistance given to one of the competitors in the recent Six Days' Trial who met with an accident and was well looked after by the officials there. A donation has also been sent to the Shrewsbury Borough Police Fund, in appreciation of the valuable assistance rendered by the police officials at Shrewsbury during the Trials.

Imports of Motor Cycles.

135 motor cycles were imported last month of the value of £3,578, and parts value £4,799, total £8,377, as compared with £7,775 in July last year. The value of the imports during the seven months ended 31st July was £43,737, representing £27,202 worth of complete machines, and £16,535 worth of parts. The imports during the corresponding period of 1908 were valued at £43,982, and in 1907 £58,033.

Exports Booming.

128 British-made motor cycles were exported last month of the value of £4,388, and parts value £2,376, a total of £6,764, compared with £4,314 in July, 1908, and £4,645 July, 1907. The great increase in the exports of motor cycles and parts during the seven months ended 31st July will be seen from the following figures:

	1907.	1908.	1909.
Number—	392	475	701
Value—	£13,864	£16,172	£24,202
Value of parts—	£16,913	£12,627	£18,898
Total—	£30,777	£28,799	£43,100

Re-exports of Foreign Motor Cycles.

Forty-nine motor cycles of foreign make were re-exported from this country during July, the value being £297. Parts were valued at £2,314. The total value of re-exports during the seven complete months of 1909 was £12,137, parts representing no less than £10,389 of that amount.

The Wigan Police.

At the Wigan Police Court on the 5th inst. a motor cyclist was fined 5s. and costs—£1 4s. in all—(licence endorsed) for recklessly and dangerously driving a motor cycle in the main part of the town. A constable's estimate of the speed was twenty-five miles per hour.

Inland Revenue Tax Exemptions.

It will be remembered that in the last issue we published a newspaper report of a police court case in which Mr. T. Buckworth, of Reform Street, Crowland, was summoned for using an unlicensed motor cycle at Crowland on July 5th. The summons was issued at the instigation of Superintendent Burton, of Spalding. Defendant claimed that he was exempt as he used his motor cycle solely for business purposes. He produced a copy

Master Crawley, of Bedford, is only just old enough to hold a driving licence, but he can manage a Triumph with the greatest ease, and his father frequently sends him on journeys of over one hundred miles.

of *The Motor Cycle* in court giving particulars of correspondence which passed between the R.A.C., A.C.U., and the London authorities on the subject of exemption. The Chairman of the Bench said the majority were of the opinion that the case should be dismissed. Superintendent Burton was not satisfied with this decision, and asked the Bench to state a case, and we were informed later that the superintendent had decided to lodge an appeal. As far as we can see there is no particular reason why a superintendent should go out of his way to spend the ratepayers' money on deciding knotty legal problems which have already been fairly well discussed elsewhere. We have been in correspond-

ence with Mr. Buckworth all along in connection with the case, and recommended him some time ago to become a member either of the A.C.U. or M.U., and we now understand from Mr. F. Straight, secretary of the A.C.U., before whom the whole of the facts have been laid, that the committee of the Auto Cycle Union has decided to recommend the R.A.C. Legal Cases Committee to defend the case if an appeal be lodged.

The Tourist Trophy Race.

Seven entries have already been received for the T. T. Race in the Isle of Man on the 23rd prox. As the whole of the expense of arranging the event will fall upon the shoulders of the A.C.U. this year, motor cyclists are asked to contribute. See this week's leading article.

Foreign Tourists visiting England.

When touring in some continental countries British motorists may use their own numbers, but foreigners visiting this country have to re-register their machines and obtain new numbers, and are also subject to the Inland Revenue licence. What encouragement for foreign tourists to visit these shores!

Passenger Vehicles.

Two very interesting passenger motor cycles are illustrated and described in this week's issue of *The Motor Cycle*. One is the A.C. tricar and the other the Chater Lea motor cycle and sidecar. The detail improvements in the former bring it right in the forefront of passenger vehicle design, while in the latter we have the last thing in sidecar outfits with chain transmission including a three-speed gear and free engine clutch. Those who contemplate the purchase of an up to date passenger motor cycle should not fail to read both these articles.

What will Win?

Opinions are divided as to the chances of a single-cylinder against the twin-cylinder machines in the T.T. race. Although in the two previous races single-cylinder machines have averaged a better speed than the multitis, it must not be forgotten that the limited allowance of petrol did not permit the machines to make their best showing. This year, with unrestricted petrol allowance, it is asking a lot for a single of 500 cubic centimetres to beat a multi-cylinder of 750 cubic centimetres—but we shall see. A well-known rider has estimated that this year's winner will average fifty miles an hour.

pen Hill-climb at Barnsley.

The annual open hill-climb at Barnsley for the Littlewood Trophy takes place on the 11th prox. Mr. F. Scolah is the secretary, his address being 49, Park Road, Barnsley.

The Sidecar End-to-end Record.

The identical sidecar driven by Mr. Olsson on the occasion of his establishing the End-to-end sidecar record is to be seen at the V.S. company's premises, 178, Great Portland Street, W. All motor cyclists interested are welcome to examine it.

Motor Cycle Thefts.

The police have informed a reader who was unfortunate enough to have his mount stolen the other day, that motor cycle thefts are rapidly on the increase. Motor cyclists, therefore, should take steps to see that their machines are either locked or are stored in safe places.

Police Traps.

Police traps are in operation between Inverness and Nairn, and from Forres to Nairn. There is a measured mile on the Elgin side of Forres, in which several motorists have been caught.

In Warwickshire, near Coventry, there is a trap between Gibbett Hill and Cannon Hill.

Two miles out of Nairn, east and west on Glasgow-Nairn road. Every day between the hours of 12 noon and 4 p.m.

More Kindness Unrewarded.

Another motor cyclist informs us that he acted the Good Samaritan on the 4th inst. four miles from Barnet, to a rider of a motor bicycle and sidecar with lady passenger who were stranded through the accumulator being exhausted. Our correspondent's name is G. Bennett, of 85, Sumatra Road, Hampstead, N.W. He is a member of the A.C.U. and the North-west London M.C.C., and knows the number of the sidecar belonging to the person who borrowed the accumulator. This registered number has been sent us in confidence, and we hope the offender will not compel us to draw other motor cyclists' attention to his discourtesy in retaining a borrowed article lent him with the sole idea of assisting him out of his trouble.

New Club for French Motor Cyclists.

There has been just established in France a club for motor cyclists, which is to be known by the name of the Motocycle Club de Paris. The address is 34, Rue Marbeuf, Avenue des Champs Elysées. Members are divided into two categories—active members, who pay an annual subscription of 25 francs, and honorary members, whose subscription is 15 francs. After the list of founder members has been completed, an entrance fee of 5 francs will be charged, except for members of the Touring Club de France. Its object, of course, is the encouragement of the pastime of motor cycling, and the club will organise weekly runs under the leadership of a member of the committee, and an important annual competition, to which the title is to be given of "The Grand Prix de France des Motocyclettes."

The Jarrott Cup Competition.

F. Mussell's name should be added to the list of gold medal winners in the M.C.C. London to Land's End and back run.

Inter-club Team Race.

At the New Brighton Tower Grounds last Saturday, at the N.C.U. (Liverpool centre) championships, a motor cycle team race between the Liverpool Motor Club and the Manchester M.C. was included. Three thousand spectators watched the proceedings. The race was over a distance of two miles, and the team representatives were: Liver-

pool. In one of the heats C. Lenty sustained a nasty fall which resulted in a broken collar-bone and severe facial injuries. A. J. Moorhouse, of Manchester, made an attempt on the mile motor cycle track record, covering the distance in 1m. 9 $\frac{3}{4}$ s., beating record by $\frac{1}{4}$ s.

A Risky Experiment.

A motorist in France, who was found to be using false registration numbers for the purpose of deceiving the authorities, has been sentenced to two months' imprisonment, and the motorist from whom he copied the number without permission has been successful in securing damages against the offender.

Motor Cycle Racing at Norwich.

At the annual meeting of the Norwich Amateur B.C. last Saturday, witnessed by 4,000 spectators, a five miles race for motor cycles was won by P. V. Wallis (J.A.P.); time, 7m. 14 $\frac{3}{4}$ s. R. O. Clark (F.N.) was second. Harry Martin attempted the one-mile flying start record, and covered the distance in 77 $\frac{1}{2}$ s.—10s. better than previous best for the track. He also lowered W. Hodgkinson's five-mile record by 3 $\frac{1}{2}$ s., his time being 6m. 55 $\frac{3}{4}$ s.

An Exciting Adventure.

A most unusual accident occurred last week to a Coventry motor cyclist touring in Scotland. He was riding in company with three other motor cyclists beside Loch Ness at 11 p.m. when the petrol tank stopper came unscrewed and some petrol was jerked out and ignited by the lamp. The whole tank at once caught fire, and the rider had just time to drop the machine on its right side. The petrol spilt out, and blazed for threequarters of an hour before any of the quartette could get near enough to the machine to put out the flames. When they did manage it, however, it was found that the tank was only leaking in one top corner, and the engine was started again at about 1.30 a.m. Despite the fact that the saddle had all gone, as well as the toolbag behind, the handlebar grips, and control wires, the machine was ridden to Glasgow by way of Ballaculish and Glencoe.

FUTURE EVENTS.

- Aug. 18—British M.C.R.C. Fifth Race Meeting at Brooklands. Start 3 p.m.
- Aug. 21—Coventry and Warwickshire M.C. Open Hill-climb for Motor Cycles.
Class I. Full Touring Machines.
Class II. T.T. and Special Machines.
- Aug. 27 and 28—Essex M.C. 24 Hours' Ride. Woodford to York and back.
- Aug. 30-31—Muratti Trophy Open 400 Miles Reliability Trials in connection with the Ulster Centre M.C.U.I.
- Aug. —A.C.U. Annual Race Meeting.
- Sept. 1.—Entries close for the Tourist Trophy Race on Sept. 23rd.
- Sept. 4—M.C.C. Members' Petrol Consumption Trial. Start 4 p.m.
- Sept. 5—Mont Ventoux (France) Hill-climb.
- Sept. 19—Semmering Hill-climb (Austria).
- Sept. 23—THE TOURIST TROPHY RACE FOR MOTOR CYCLES IN THE ISLE OF MAN.
- Oct. 2—Race meeting at Brooklands.
- Oct. 9—Proposed Two Hours Record Race at Brooklands organised by the British M.C.R.C.

pool—C. Lenty (3 $\frac{1}{2}$ T.T. Triumph), F. C. Jones (3 $\frac{1}{2}$ Rex Speed King), G. H. Owens (5 Peugeot), and E. F. Baxter (5 Rex). Manchester—H. Reed (5 Dot), O. Thomas (5 Peugeot), W. Heaton (3 $\frac{1}{2}$ Rex), and A. J. Moorhouse (T.T. Triumph). Two rounds were decided, each team winning four races. In the decider Jones (Liverpool) opposed Reed (Manchester), the last-named winning easily. Manchester thus won by the odd

The Manchester Team which beat Liverpool at New Brighton on Saturday last by one point only.

THE DOUGLAS CARBURETTER.

THE special carburetter used on the $2\frac{3}{4}$ h.p. horizontally opposed Douglas engine is of the single jet type, with the air and throttle openings controlled by means of the usual handle-bar levers and Bowden wires. It is shown in section in the accompanying line drawing. The lid of the float chamber A, which carries the needle valve balance weights B, can be taken off for cleaning and adjusting purposes by means of the nut on the float chamber lid. As will be seen, the needle C and float are of the usual pattern. The jet tube D has a round top, and the petrol is drawn by the suction of the engine over the piston throttle E through the outlet hole. The throttle E, as will be noticed, is cone shaped, and as the piston throttle rises and falls to close and open the orifice, the space around the jet tube is varied, so causing a variable suction on the petrol, or a variation in the depression in the carburetter, which conduces to easy starting, and a constancy in the quality of the mixture. G is the main air inlet, and additional air can be admitted by opening the piston throttle F, which gradually uncovers a hole H $\frac{7}{8}$ in. deep by $\frac{3}{16}$ in. wide in the side of the chamber. The additional air passes along the passage J to the inlet pipe opening L. The jet D can be cleared by a piece of fine wire after removing the screw K at base. Another screw M can be removed for clearing the passage

between the float and spray chambers. The carburetter parts are readily dismantled, a small screw and clamp N securing the additional air chamber to the spray chamber cover, which latter is screwed into the chamber. In the illustration the throttle and additional air inlet are shown open.

Sectional drawing of the Douglas Handle-bar controlled Carburetter.

THE MURATTI TROPHY TRIALS.

In connection with the Muratti Trophy Reliability Trials on the 30th and 31st insts., the Ulster Centre M.C.U.I. are giving gold medals to all riders securing ninety-five per cent. of full marks during the two days,

Motor cycle races at New Brighton on Saturday last. A. J. Moorhouse ($3\frac{1}{2}$ h.p. Triumph) who reduced Harry Rignold's one mile record for the track by one-fifth of a second. Rignold's time was 1 min. 8 $\frac{3}{4}$ secs.

and a silver medal to all who secure ninety per cent. The holder of the trophy is Mr. J. Stewart, Belfast, and should he succeed in winning it this year it will become his own property.

The title of the firm of Hayes, Fenn, and Co. has been altered to A. G. Fenn and Co., 27, Mortimer Market, Tottenham Court Road, W.C.

THE IRISH END-TO-END RECORD.

Mr. C. E. Murphy, of Cootehill, a member of the Ulster Centre M.C.U.I., was to make an attempt on the Irish End-to-end record yesterday, his machine being a $3\frac{1}{2}$ h.p. T.T. Triumph. We hope to give full particulars of the ride in our next issue.

EARLY ENTRIES FOR THE T.T.

Last week, seven entries had already been received for the T.T. Race, which augurs well for its success. The entries are:

- Triumph Cycle Co. ($3\frac{1}{2}$ h.p. Triumph) (holders).
- H. Reed (5 h.p. Dot) (holder of the twin trophy).
- Norton Mfg. Co. ($3\frac{1}{2}$ h.p. Norton, 496 c.c.)
- Noel E. Drury (5 h.p. J.A.P., 680 c.c.)
- W. H. Wells (5 h.p. Indian, 744 c.c.)
- W. H. Wells (5 h.p. Indian, 744 c.c.)
- S. C. Perryman (5 h.p. Norton, 742 c.c.)

Pullman's "Fireking" fire extinguisher has been introduced to quell an outbreak at the beginning. It consists of an ornamental metal tube 14 in. long by 2 in. in diameter, which is secured to the frame tubes of a motor bicycle by means of spring clips. In case of fire the contents of the metal tube are thrown with a forcible sweeping motion into the base of the flame, and the makers assert that neither the gas nor powder evolved from it are harmful to either machine, body, or clothing. An important point is that extinguishers used in actual motor fires will be filled free of charge; thus the first cost is the only cost. The circular says that leading fire insurance companies allow a substantial rebate off premiums when machines are fitted with the "Fireking" extinguisher. It is sold by R. M. Pullman and Bros., London Road, Norbury, S.W.

The Motor Union and Military Motor Cycling.

THE immediate response to the paragraph under this heading which appeared in *The Motor Cycle* of July 28th shows that a very large number of members of the motor cycle section of the Motor Union are not only willing to assist at military manœuvres, but are also in many cases specially qualified to do so. Of those who offered to assist at the Army manœuvres in September next a large number have already undergone a considerable amount of military training, and, in addition to this, have gained a knowledge of the country whilst touring on their motor bicycles, which is hardly to be found in

Officials of the Notts. and District M.C.C. Petrol Consumption Trials measuring the precious fuel. Dr. Ed. Bigg, the donor of the prize, is holding the measuring glass.

the non-motoring civilian. Motor cyclists will therefore welcome the statement of the Army Council that they are considering at the present time "a scheme for utilising in connection with national defence the

services of individuals, who, though not forming part of the military forces of the crown, might yet be able in time of national emergency, owing to special aptitudes, to assist the military forces." The exact conditions which shall govern the organisation of this Technical Reserve have not yet been fully elaborated, and it is therefore premature at the present time to discuss the details of the scheme, but the Army Council consider that much valuable experience, both from a military point of view and from the point of view of the individuals who may ultimately be willing to enrol themselves in the Technical Reserve, will be gained if a limited number of civilian motor cyclists take part in the forthcoming Army manœuvres in September next. Should this experiment prove successful, it is probable that the Army Council will put forward a definite scheme which shall enable all those motor cyclists who are willing to place their machines at the disposal of the country in case of national emergency an opportunity of obtaining the necessary military experience. The Motor Union will therefore be glad if all motor cyclist members who would be interested in such a scheme will communicate with the secretary, in order that a register of such members may be kept, and in order that they may be communicated with at a later date. For the present experiment the Union received many times the requisite number of offers. Those finally selected have been chosen either in view of special qualifications which they would seem to possess or in order to ascertain the respective merits, from a military point of view, of the different types of machine which they propose to use. Those selected include a tricar and motor bicycles ranging from light 3 h.p. engines to a heavier make of 9 h.p. It will be interesting to see which prove the more serviceable in the manœuvres.

ENTRIES FOR THE COVENTRY & WARWICKSHIRE HILL CLIMB.

A LARGE and representative entry has been received for the above club's hill-climb next Saturday, at a venue which will be announced to competitors on Friday. Only two classes have been included, and will be noticed that the entries are very evenly divided:

CLASS I. For motor bicycles in full touring trim, and fitted with an efficient silencer, spring front forks, two brakes, metal motor cycle mudguards at least 3½ in. wide, touring saddle, standard size roadster motor cycle tyres, toolbag with tools weighing not less than 5 lbs., stand, and motor cycle horn. Limit capacity, single-cylinders 500 cc., and twin-cylinders 750 cc.

L. Norton (3½ Norton)
W. H. Wells (4.9 Indian)
L. Cooper (3½ Triumph)
Eg. Samson (3½ L.M.C.)
Geof. Smith (3½ Triumph)
Lee-Evans (4.9 Indian)
W. Barnes (3½ Zenith Gradua)
E. Stanley (3½ Premier)
Boy W. Walker (3½ Premier)
D. Teage (3½ Premier)
Frank White (5 Rex)
C. Bagshawe (5 Rex)
Lord (3½ Rex)
Winslow (5 Rex)
Smith (3½ Triumph)
W. Applebee (5 Rex)
Marshall (3½ Triumph)
Creyton (3½ Triumph)
A. Gorton (3½ Rex)

S. Davis (3½ Rex)
W. Jones (1½ Wolf)
W. H. Bashall (3½ Zenith Gradua)
R. H. Edwards (3½ Triumph)
R. T. Exshaw (3½ Zenith Gradua)
R. M. Brice (3½ Brown)
H. Bevir (3½ L.M.C.)
E. S. Myers (3 Scott two-stroke)
T. H. Tessier (3½ Bat-J.A.P.)
P. Baker (2½ Elec. Minerva)
R. N. Corah (3½ Corah)
W. W. Douglas (2½ Douglas)
Eli Clarke (2½ Douglas)
T. Peck (3½ Rex)
J. Leno (3½ Premo, two-stroke)

CLASS II. For all Tourist Trophy and other special or racing models. Exhaust pipes and silencers to be fitted.

J. L. Norton (3½ Norton)
A. Mackenzie Cott (7-9 King-J.A.P.)
W. H. Bashall (7-8 Bat-J.A.P.)
J. T. Bashall (3½ W.H.B.-J.A.P.)
T. Silver (3½ Quadrant)
F. W. Barnes (3½ Zenith Gradua)
G. E. Stanley (3½ Premier)
H. G. Potts (3½ T.T. Triumph)
F. C. Bagshawe (5 Rex)
A. G. Fenn (3½ Triumph)

J. C. Smyth (3½ Rex Speed King)

J. P. Le Grand (3½ Rex)
W. A. Jacobs (3½ Rex)
W. O. Bentley (3½ Rex Speed King)
J. Marshall (3½ Triumph)
W. F. Newsome (3½ Triumph)
A. V. Sumner (5 T.T. Vindec)
H. D. Teage (3½ Premier)
Geof. Smith (3½ Triumph)
E. Kickham (7 Leader-Peugeot)
R. T. Exshaw (3½ Zenith Gradua)
J. W. Waring (8 Minerva)
G. Jones (6-7 Bat-J.A.P.)
W. W. Douglas (2½ Douglas)
F. C. Wood (4 two-speed N.S.U.)

Weighing will take place from 11 a.m. to 1 p.m. The start of the competition is at 3 p.m. A special committee of scrutineers will inspect the machines in Class I., and any found to depart from the rules will be relegated to Class II.

MOTOR CYCLISTS AND OLYMPIC GAMES.

If there were any competitors in the 1908 Olympic Games who have ever competed under A.C.U. rules on a motor cycle will they kindly communicate with the Editor?

CLUB NEWS.

Eastern District M.C.

The competition for the President's Trophy was run off on the 8th inst. Winner, J. Babbage, $4\frac{1}{2}$ h.p. Minerva twin; second, F. W. James, $3\frac{1}{4}$ h.p. Cottereau-Minerva.

Cardiff M.C.

A reliability trial for cars and motor cycles will be held to-day (Wednesday) and Saturday next, the 21st inst. The start will be at 2.30 from the Power Station, Newport Road, to Newport, turn up Waterloo Hill, Stow Park to Bassaleg, and back to Cardiff and Newport main road at Tredegar Park. The latter portion will be repeated until such time as the timekeeper shall think fit.

Middlesbrough and District M.C.C.

The above club will hold a twenty-eight hours' run on August 28th and 29th to London and back. The committee hope that all clubs affiliated to the Northern League will send a team of three riders to compete. Competitors will start at three o'clock on Saturday afternoon, and are due back in Middlesbrough at 7 p.m. next day. As the time is rather short, the committee would be much obliged if any club would be willing to check the competitors at Barnet about 5 a.m. on the 29th inst.

Sheffield and Hallamshire M.C.C.

The first final of a series of monthly bogey hill-climbs arranged by the above club took place on the 7th inst. Competitors were allowed six ascents to be run any time during the three weeks previous to the final, which latter in this case was postponed for one week owing to bad weather. The award, the club rose bowl, is taken by D. Bradbury ($3\frac{1}{2}$ h.p. Norton), whose nett time was $31\frac{1}{2}$ s. T. Durant ($3\frac{1}{2}$ h.p. J.A.P.) comes second with 33s., and T. Dover ($3\frac{1}{2}$ h.p. Triumph) third with $33\frac{3}{4}$ s. T. Dover made fastest time in $33\frac{3}{4}$ s., T. Durant coming second with 34s., and Bradbury third with $36\frac{1}{2}$ s. As the handicapping committee have now some data to work on the August event should see some very close finishes.

Nottingham and District M.C.C.

The above club held a petrol consumption test on the 14th inst. for the gold medal presented by Dr. Ed. Bigg. The competitors had to run over a twenty-two miles course three times, and to complete each circuit in and between a

Nottingham and District M.C.C. Petrol Consumption Trial. A group of competitors.

minimum and maximum time of 1h. 10m. to 1h. 20m. At the completion of the sixty-six miles the amount of petrol consumed was measured, and the result worked out as per table annexed:

		Gross weight.	Capacity.	Petrol used.
			c.c.	pts. ozs.
1.	G. Brough (5-6 Brough)	348	662	2 15
2.	W. Reilly ($3\frac{1}{2}$ Triumph)	356	476	2 10
3.	F. B. Johnson ($3\frac{1}{2}$ Humber)	424	487	4 18
4.	J. Fairburn ($3\frac{1}{2}$ C.C.R.-Smith)	320	452	3 9 $\frac{3}{4}$
5.	L. A. Nolan ($3\frac{1}{2}$ Triumph)	324	476	4 0
6.	C. H. Sewell ($3\frac{1}{2}$ Triumph)	312	476	4 5
7.	A. E. Lole (5-6 F.N.)	388	463	5 3
	F. Garratt ($2\frac{1}{2}$ N.S.U.)	280	not given	3 8

J. King (5-6 F.N.) retired; two nuts missing, crank case.
G. H. Pearson ($2\frac{1}{2}$ Bentinck) retired; broke belt fastener twice.

Total weight in lbs. of rider and machine \times Capacity of engine in cubic centimeters

Formula used:

Petrol consumed in ozs.

Distance, sixty-six miles.

Barnoldswick M.C.

A most successful hill-climbing competition took place on the 10th inst. at Salterforth. The hill is situated midway between Colne and Skipton just off the main road, and it is an ideal venue for a competition of this nature. Results 1, James Windle; 2, W. Holden.

Hull and East Riding A.C.C.

The Reliability Competition, to be held on Saturday next the 21st inst., will be over the following route: Hull (Haworth Arms), Beverley, Driffield, Bridlington, returning via Carnaby, Lissett, Beeford, Brandesburton, Leven, Long Riston, Skirlaugh, Coniston, Sutton, Stoneferry, and Newland. Entrance fee, 2s.; start 2.30 p.m. Awards: 1st prize, given by Mr. Geo. Wade, patron; 2nd prize, medal presented by Mrs. Crawford; 3rd prize, 1 gallon motor oil. No prize will be awarded if less than four starters (the competition being declared void), no second prize if less than six, and no third prize if less than thirteen. The committee earnestly hope that all members will enter this competition, as the success of all competitions depends upon their being well supported. One of the conditions is that the machines and accessories used must be the bona-fide property of the riders.

A hill-climbing contest will take place on Saturday, the 28th inst., at High Hunsley, South Cave; meet at 2.30 p.m. at South Cave Station. The competition will be divided into the following classes: Class I., for motor cycles with engine of a bore and stroke not exceeding 76×76 mm.; pedalling allowed. Class II., for motor cycles made in 1905 or earlier and with any size (single) cylinder; pedalling allowed; any question as to the age of any machine will be settled by the inspecting committee. Class III., open for any single-cylinder motor cycles; pedalling not allowed; entrants in Classes I and II. are eligible to compete in this class. Class IV., for twin-cylinder motor cycles; pedalling not allowed. Class V., for passenger motor cycles; pedalling will be allowed if machines are not fitted with a two-speed gear. There are three awards in each class.

Sutton Coldfield A.C.

The above club held a hill-climbing competition on Saturday last on a steep hill rising from the Severn valley at Coalport near Shifnal. This hill, which is on a semi-private road controlled by toll gates at each end, is rather difficult to negotiate. It commences immediately the toll gate is passed with a bend to the right, followed directly by a sharper curve to the left over a bridge spanning the G.W.R. line; then comes an easy bend to the right and a stiff stretch of about 1 in 8, then a long pull for about 200 yards. The most difficult point to negotiate is about two-thirds of the way up. This consists of a miniature Devil's Elbow on a gradient of about 1 in 8. All the motor cyclists had to switch off for this; in fact, it would be impossible to get round it on a motor bicycle without reducing speed.

H. Rem Fowler was strongly fancied as winner of the motor cycle class, and, judging by the way he took the hairpin bend, and the speed at which his twin Rex picked up afterwards, we quite thought he had made fastest time. However, Fowler had a little trouble at the start with the mixture, and therefore, although he travelled well when he passed us he did not get up speed so quickly as the $3\frac{1}{2}$ h.p. Premo—a new comer, fitted with an experimental two-cycle air-cooled engine, made by the Premier Motor Co., Birmingham. This machine, ridden by J. Leno, ascended in 1m. 16 $\frac{3}{4}$ s., as compared with Fowler's twin Rex, which was $\frac{3}{4}$ s. slower.

The other competitors were R. Pritchard ($3\frac{1}{2}$ h.p. Rex) time 1m. 37s.; H. Smith ($3\frac{1}{2}$ h.p. Triumph), 1m. 41 $\frac{3}{4}$ s. (who rode a punctured rear tyre from the bend to the summit); S. Smith (5 h.p. Norton), 1m. 42s.; H. R. Lane ($3\frac{1}{2}$ h.p. Triumph), 1m. 45s.; and A. Manning Lomax ($3\frac{1}{2}$ h.p. Triumph), 1m. 46 $\frac{3}{4}$ s. The competition was supposed to start at 3 p.m., but owing to failure of the electrical timing arrangements it was nearly five before the competition started, although a fair amount of practising was indulged in during the somewhat tedious wait.

Six competitors drove cars, varying in power from a 4 h.p. Sizaire and Naudin to a 40 h.p. F.I.A.T., the fastest time being 1m. 35s. made by Mr. Kirk's 15 h.p. Talbot. Motor cyclists were requisitioned to take the competitor times up and down the hill, and generally keep the timekeepers in touch with one another.

News.—

Great Yarmouth and District M.C.C.

In the 200 miles reliability run held last month, F. G. ley, riding a $3\frac{1}{2}$ h.p. Brown was placed seventh with twenty-three marks lost. His correct place was second, losing four marks only. His checking card had been signed wrongly, and a figure 3 was taken for 5. He completed the journey without any mechanical or tyre trouble.

Essex M.C.

Country forms have now been issued for the twenty-four hours' ride from Woodford to York and back, and it is expected that a large number of members will make an effort to win the Palmer Tyre Cup. Gold and silver medals are being offered to all competitors completing the journey within schedule time. The route, which is not a very difficult one, is *via* Cambridge, Huntingdon, Grantham, Doncaster,

Jack Scriven, a well-known and successful Yorkshire motor cyclist on his Twin-cylinder Rex.

Doncaster, and York. The start takes place from the Castle Hotel, Woodford, at 7 p.m. on Friday, August 27th, and finish at the same place at 7 p.m. on Saturday the 28th. Arrangements are being made previous to the start at the Castle Hotel at 5 p.m. Will those who would like to be present

please let the secretary know. On the 29th a number of members are going for the 200 miles standard medal, leaving headquarters at 8 p.m.

Motor Cycling Club.

A petrol consumption trial for standard types of touring machines is to be held on the 4th prox., starting at 4 p.m. Meet at the Bull, Gerrard's Cross, main Oxford Road, between Uxbridge and Beaconsfield. Three classes have been arranged. I., for single-cylinder bicycles, II., for multi-cylinder bicycles, III., passenger machines (including cars but not trailers). Shell spirit at the rate of 1 pint for 300 lbs. total weight, increasing to $1\frac{1}{2}$ pints for 600 lbs., and to $2\frac{1}{4}$ pints for 1,200 lbs. in the passenger class, irrespective of size or type of engine, due allowance being made for all intermediate weights, will be supplied to the competitors. Multi-cylinder machines in Class II. over 150 lbs. in weight will be allowed thirty per cent. extra spirit. The driver covering the greatest distance on the spirit allowed shall be declared winner in his class. Entries close on the 30th inst. to the Trials hon. sec., Harry G. Bell, 52, Station Road, Finchley, N. Fee 2s. 6d.

Leeds M.C.C.

The official results of the hill-climb held on the 7th inst. are published below. The following qualified to ride in the final:

Class I. (for single-cylinder full touring models).—1, P. H. Cockcroft ($3\frac{1}{2}$ h.p. Triumph), X; 2, A. B. Hughes ($3\frac{1}{2}$ h.p. Triumph), $\frac{1}{5}$ s.

Class II. (for single-cylinder T.T. and racing models).—1, W. D. Shaw ($3\frac{1}{2}$ h.p. T.T., Triumph), X; 2, F. Mackay ($3\frac{1}{2}$ h.p. T.T. Triumph), $\frac{1}{5}$ s.

Class III. (for twin-cylinder machines, racers allow $7\frac{1}{2}$ % to touring models).—1, Fred C. Bagshaw (5 h.p. Rex Speed King), X; 2, A. H. Hyde (7 h.p. Vindec-Special), $8\frac{3}{5}$ s. (received $7\frac{1}{2}$ % allowance).

These riders were again despatched up the hill with a view to attempting to improve on their respective times, and the result worked out as follows: 1, J. A. Mackay ($3\frac{1}{2}$ h.p. T.T. Triumph), $1\frac{2}{5}$ s. faster, silver cup and gold medal; 2, W. D. Shaw ($3\frac{1}{2}$ h.p. T.T. Triumph), $\frac{2}{5}$ s. faster, silver medal; 3, A. B. Hughes ($3\frac{1}{2}$ h.p. Triumph), $\frac{2}{5}$ s. faster, bronze medal.

Fastest time of the day was made by F. C. Bagshaw (5 h.p. Rex).

In his now famous ride from John-o'-Groat's to Land's End, we are informed, Mr. Vivian Olsson used only one Shamrock $1\frac{1}{2}$ in. belt, which gave every satisfaction. This speaks exceedingly well for the belt, as all users of motor cycles and sidecars fitted with this type of transmission can fully appreciate. The Shamrock Excelsior tyres also behaved in an exemplary manner, although the roads, especially over the Grampians, were excessively loose.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Lubrication.

[4197.]—I see that "Oile" [letter 4058] in *The Motor Cycle*, has made some interesting experiments with regard to the amount of lubrication which shows that the majority of machines are over-lubricated. I had a similar machine last year and oiled as per instructions, and found that the valves pitted very quickly, and the rings choked up with carbon. I then used Wilburine, and actually did forty-five miles per pump, and perhaps I could have done more, but did not like to risk it. I am now riding a 1909 similar machine and dose it every thirty miles, which is as much as I dare do in this county (Devon). The result is that I have done over 1,200 miles without grinding valves or clearing the cylinder, and the compression is quite as good as ever.

TEMERAIRES.

The Quarterly Trials.

[4198.]—As a competitor in the last A.C.U. Quarterly Trials may I be allowed the space to make a few remarks relative to the eccentric manner of awarding marks.

Having punctured about half-way on the return journey I was out of the running, and quite prepared to find marks deducted accordingly, but was much astonished to find one mark deducted for brakes in my case (I was riding one of the three N.S.U. lightweights) and full marks awarded the other two identical machines (with the exception that one of them was minus any kind of lining to its brake shoes).

I notice towards the end of the list a 6 h.p. machine, which failed on both Dashwood and Rectory Hills, and arrived in a very dirty condition, owing to leaky oil pumps, received thirty-five marks for reliability!

I also note a machine which lost marks for silencer in the previous trials this time gains full marks for the same silencer.

Perhaps some of the readers of your most excellent paper can furnish a satisfactory explanation, and greatly oblige

W. J. AKERMAN.

Standard Machines in Competition.

[4199.]—In the issue of July 28th I see that "Ixion" refers to the Trump-J.A.P. machine, made by me, and on which I have had some success at Brooklands.

With reference to his statement *re* standard machines, I think, perhaps, the following details about my machine would be of interest.

The engine is a standard 85×85 plain bearing 4 h.p. 1909 J.A.P. As regards the compression, this is exactly the same as all the standard 4 h.p. J.A.P. engines supplied by John A. Prestwich. There are no extra exhausts drilled in the cylinder, and I use the same silencer on the track as I do on the road. With the same engine I have obtained a non-stop in the Quarterly Trials—in fact, all my road work is done on this engine, as it is the only one I possess.

It might also interest your readers to know that my weight is over fifteen stones—which I think speaks very highly for the efficiency of the engine and machine.

Should "Ixion" at any time care to examine my machine either before or after a race at Brooklands, I should be pleased to let him do so, in order that my statements may be verified.

FRANCIS A. McNAB.

[4200.]—Whatever Mr. W. A. Jacobs [letter 4173] may say about the Speed King Rex model, I must emphatically state that O. C. Godfrey's machine on which he won a Sutton Bank was not a tourist motor cycle. The greenes amateur could see the racing saddle, short handle-bars, and drilled lugs, all designed to get the rider up the hill at highest possible speed. There were others.

I hold no brief for any make of motor cycle. There can be no disputing the fact that the touring amateur supports the motor cycle industry. He has had to pay bitterly for the evolution of the motor cycle, and is entitled to the respect and fair treatment of the trade. Instead of that we find him continually blinded and led astray by rival manufacturers, who seek only to extract his cash from him. Some of them give fair return for this consideration, and some do not.

Trade riders and "shamateurs" should be in a class apart in every public event. It would not do to exclude them, they are clever and daring riders generally and are good sportsmen. But the average rider who is in competition with them will find he has no chance to win. W. E. HOLMES.

Transmission on Motor Cycles.

[4201.]—I am exceedingly pleased to see the letter signed "Waiting" in the issue of August 4th on the subject of chain transmission, which I trust will open an interesting and enlightening discussion on this subject.

Many others noticed the splendid condition of all of machines fitted with chain drive at the conclusion of the Six Days' Trial this year.

Before I decided to introduce the Indian motor cycles in this country fitted with chain drive, I became thoroughly convinced that this transmission was not only more economical, but gave far better results than the belt drive, although the makers were quite willing to fit the belt drive, and in fact do so whenever their customers desire it. I also remembered the successful manner in which the Phelon and Moore chain-driven machines went through the Six Days' Trial year after year, ridden by Mr. Moore and Mr. Milnes, as well as J. Crundall's successes on the track with the old chain-driven Humber. J. Van Hooydonk, one of the pioneers of the motor industry, remarked, when I showed him the chain-driven Indian, that I had made no mistake in that particular machine; he was convinced many years ago that it was the correct drive for a motor cycle.

A Renold chain costs no more than a first-class belt, and I believe with reasonable care will outwear two of the latter. If a friction grip either on the engine-shaft or on the coupling shaft be used in connection with the chain so as to avoid a slight slip when starting, there is absolutely no jar on the engine or undue wear on the tyres—in fact, it is smoother than a tight belt.

A paragraph in one of the London daily papers referred to the last Brooklands meet, which says, "W. H. Barkley was coming well to the front, and had his belt not broken would probably have altered the results of the finish." Very significant considering the fact that a chain-driven machine actually won the race.

W. H. WELLS.

[4202.]—Why do some readers periodically ask that question, "Why do our best makers continue to use the belt drive, when the chain is so much more mechanical,"

The subject has been well threshed out in *The Motor Cycle*, and ninety-nine per cent. decide in favour of the belt account of—(1) smoothness of drive, (2) absolute silence, (3) ease of repair, (4) cleanliness and many other advantages. The objections are (1) dirty (and always will be until completely enclosed in an oil bath case), (2) much more jerky than a belt, (3) prone to transmit more vibration to the rider, (4) difficult to repair, (5) almost impossible to keep at the correct tension, and (6) should the engine jam a bad spill is inevitable.

I may say the above is not written without experience. I have not ridden in a light suit or flannels on a chain-driven motor cycle I once owned, but on my motor bicycle with rubber drive I daily ride a short distance in white flannels in the summer months, and never get "speckled." Still, there is another outstanding objection to the single-gear chain-driven machine, also the shaft-driven motor bicycle, and that is the inability to rapidly alter the ratio of gear. This defect does not seem to be generally appreciated by riders who clamour for something better than the belt, but if "Waiting" had seen one of the A.C.U. Six Days' Trials competitors pushing his 5 h.p. chain-driven bicycle up Bird's Nest simply because his gear was fixed, he would not be so anxiously waiting for all machines to have chain transmission. With an adjustable pulley and two belts of different lengths one can change gear in two minutes, and ride in all districts in absolute comfort without any necessity to "push." Let me explain, however, that I do not consider the belt by any means perfect; still, having tried all kinds of transmission, I am convinced which is best at present.

SEVEN YEARS' EXPERIENCE.

Reliability and Road Shocks.

[4203.]—*Re* "Ixion's" comments on the so-called recent reliability trials. I am quite in accord with his remarks as to where reliability comes in where the rider has time practically every day to replace nearly any defect which a machine is likely to develop. Personally, I should be very sorry to have a machine when I set out on a 1,000 miles ride with the prospect of an hour's tinkering every day. *Re* letter 4168. Is not Mr. McGow confusing road shocks with mechanical vibration? I find that when travelling slowly the inequalities of the road make themselves very evident, and when accelerating to high speed the vibration through the footrests, which is mechanical, is greatly augmented. I can with pleasure recommend an N.A.B. spring rider as highly conducive to comfort, being a most efficient shock absorber, care, when ordering, being taken to state rider's weight.

H. P. LEWIS (CAPT.)

The Actual Horse-power developed on the Road.

[4204.]—The subject of the horse-power of motor cycles, and the method of computing same by a brake test, at a certain number of revolutions per minute, has recently occupied itself upon my consideration, and compelled me to ask myself the question, "Does the average motor cycle engine develop these number of revolutions on the road?" So for curiosity I set to work and made a calculation of the speed it should be travelling if, on the level, I allowed my engine to develop the standard number of revolutions per minute.

Taking the standard of an average Triumph, with 26in. wheels, geared 4 to 1, the h.p. of which is calculated at 100 r.p.m., I find that the formula runs,

$$26\text{in.} \times \frac{2}{7} \times 1,800 \times 60$$

$$4 \times 12 \times 3 \times 1,760$$

It works out at about $34\frac{2}{3}$ —roughly, 35 miles per hour (considerably above speed limit).

A little calculation will show us that to run at 20 m.p.h. in the above gear the engine must not make more than 30 r.p.m., which means, not $3\frac{1}{2}$ h.p., but 2 h.p. or less.

The N.S.U. singles are geared $4\frac{1}{2}$ to 1, and their h.p. is calculated at 1,500 r.p.m., but with 26in. wheels this works out at 1,500 r.p.m. at about 25 m.p.h.

The power of climbing hills is therefore all the more doubtful with a high top gear, which doubt is very greatly intensified if the machine is very literally a heavyweight. A top-speed gear, such as the N.S.U., is therefore almost imperative, but in my opinion the reduction should be not less than 50%, even for a top gear of $4\frac{1}{2}$ to 1.

JOHN HODGKIN (REVD.)

Most any gear can be used with an adjustable pulley.—ED.]

Absurdities at Horsham.

[4205.]—I should like to point out an absurdity which exists in Horsham. At the commencement of a narrow street leading to the Brighton Road there is a small dilapidated sign bearing a legend to the effect that a five-mile limit is imposed. Further up the street there is another notice suspended about the level of the eaves of the houses, which a policeman told me bore the same words. If one looked up, there was a danger of running into somebody, and if looking (as one should do) straight ahead the notice could be easily missed, especially as the earlier one is nearly illegible.

I would also take this opportunity of calling the attention of the police authorities to the fact that their plain clothes officer on the trap outside Reigate might be instructed to ask for licences in a civil manner, not as though every motorist was a convicted criminal.

ARTHUR PENNINGTON.

The Wear of Motor Cycle Engines.

[4206.]—I see your contributor "Ixion" makes some remarks regarding this year's ultra-efficient single-cylinder engines. I entirely agree with him, but I do not think he has pointed out the chief disadvantage of such engines. I refer to the rapidity with which they lose tune. I have possessed many motor cycles, but my last single-cylinder of very well-known make required returning to the makers about every three months or even less for a new gudgeon pin and even piston to be fitted. This, doubtless, was partly caused by overheating on hills as pointed out by "Ixion."

R. S. Osborne negotiating Steep Hill, Lincoln, on a $3\frac{1}{2}$ h.p. machine, fitted with Osborne variable pulley and sliding back wheel. The gradient is 1 in 4.

I also read a paragraph regarding Mr. Hugh Gibson's fine ride during one week, in which you state his machine pulled well at the end of 1,500 miles; but ought this to be remarkable? Surely the "life" of a first-class engine in the hands of an expert driver ought not to go in a distance which, as far as a car of good make is concerned, would merely run in the bearings.

The motor cycle is in the majority of cases the poor man's motor, and should, therefore, at least equal the wear of a car. We do not have racing engines on our touring cars although by doing so we should at first obtain more power and speed. They are unsuitable for touring, and so, in my opinion, and I think that of many others, is the present ultra-efficient single-cylinder cycle engine.

I am now riding a twin-cylinder motor cycle, but am anxiously awaiting a single-cylinder engine which will not wear abnormally or overheat on these Devonshire hills.

DOUGLAS J. HOBGEN.

A Savage Fine and the Result.

[4207.]-I am sure you will sympathise with me in the following:

On the 9th of last month I took a quiet drive to Brighton—my first and last—and, to my surprise and disgust, I received a notice, at a week's later date, that proceedings would be taken against me for exceeding the speed limit between certain milestones outside Handcross.

Ye gods! what a charge! I can truly say a more careful driver it would be impossible to find. My machine—a Phelon and Moore fitted with Cowey speed indicator—went through all villages on low gear and half-compression, and my average speed through ten limits was not more than 8 m.p.h. However, being a member of the A.C.U., I placed the summons with our solicitor, who dealt with it at Haywards Heath on the 28th ult., and to my surprise and disgust I received a letter from him saying I was fined £5 and £1 2s. 2d. costs.

Putting my speed at about 20 m.p.h., how unjust, how wicked! If this sort of thing continues it will be absolutely impossible for one to motor. This has cost me, with solicitor's fees, £7 3s. 2d. I regret to say I have now sold my machine for half its cost, and hundreds more will follow suit should they motor Brighton way. My advice is, dear pals, keep away from Brighton. I have given up motoring until there are different laws from those now in force. But your journal will always find its way to a constant reader.

ARTHUR F. JEFFERIES.

Secondary Brakes.

[4208.]-Referring to "Ixion's" comment on the subject of secondary brakes, in the issue of the 4th inst., we should like to point out that, properly fitted, the Bowden front rim brakes as supplied by us are in every way suitable and quite powerful enough for any motor cycle on the market. We find, however, that in some cases a licensee, presumably with the object of effecting a small economy, will use levers and shoes wholly inadequate in conjunction with our Bowden wire mechanism. In many cases these levers and shoes are those used for pedal cycles, and it is not surprising that botched up jobs of this kind should often prove unsatisfactory.

We ourselves this year have had enormous trouble in adapting our front rim brakes to front forks of apparently every conceivable design. Of late there has been a veritable craze for change in the matter of front fork design, and of course when the average designer conceives a front spring fork the very last thing he thinks of is how a brake is to be fitted to it. It is to be feared he too often relies upon the ready adaptability of the Bowden wire mechanism to get him out of his trouble, but we need hardly say there are limits to that as there are to most things.

E. M. BOWDEN'S PATENTS SYNDICATE, LTD.

A Plea for Surface Evaporation.

[4209.]-"No. 13's" experiences in the recent A.C.U. trials leads me to ask one or two questions. Let me first say that I am a comparative novice at motoring. Last October I invested in a $3\frac{1}{2}$ h.p. Excelsior tricar, with M.M.C. engine and surface carburetter.

Now I have had a lot of experience and fun with this machine, but after I had once got used to her (why do motorists always say "her" when referring to their machine?) I found that I could do 27 m.p.h. on a good road with two up, and take hills of 1 in 12 and 1 in 10 at a good speed. The engine was an excellent starter, and after a warming up on the stand one push at the pedals was enough. The speed on good roads was only limited by the amount of gas and spark advance I gave her, and she always came home. The variations of gas and air were infinite, and one could crawl or fly as wanted.

After a while I thought I would sell and get something a little more powerful, but I found that a possible buyer always condemned the machine and refused to buy because she had a surface carburetter. I therefore fixed a spray, and was told that if I did so I should get more power. I find now that she is not a whit more powerful, and not as ready at starting, and that the speed is not as easily regulated, while there is more tendency to overheat. Now, with the old carburetter, let the day be never so muddy and the rider well splashed, the engine hummed away, and did not mind at all. Same in dusty weather—I never had to get off to clean the carburetter, and never had an involuntary stop, and, moreover, did not use as much petrol.

I am constrained to ask if the modern carburetter is an advance on the old surface; is it worth the price? Look at the small pipes subject to vibration and liable to fracture, the trouble of tickling it from time to time, choking of jet, and the fact that each one has to be adjusted to its particular machine, I am inclined to doubt it. True, you have to warm up the surface to get the best results, but does the same hold good with the modern ones? Then, if the machine was not festooned with controlling wires, as with the present-day handle-bar control, and the trouble of moving levers placed conveniently on the tank is, I think, not exaggerated. If "No. 13" had been fitted with a surface carburetter would not have required any paraffin.

To conclude, is not one of the most expensive and unsuccessful cars (Lanchester) of to-day fitted with a surface (wick) type? If it is good enough for cars, why not for motor cycles? The surface, in my opinion, is a "no trouble" kind, and that is the kind the average motorist wants—one that always does its work without any fuss being made about it.

CYGNUS

[There is a good deal to be said for our correspondent's argument. Bulk and weight were the chief things which condemned the surface type carburetter on motor cycles. That the battery space is seldom required, it might be said, but someone to try an efficient type of surface or wick carburetter on a motor cycle. Carbonisation of piston would doubtless be greatly reduced, owing to the majority of the dirt and dust being left in the bottom of the carburetter, as riders of early types can testify.—ED.]

Sunday Competitions.

[4210.]-I quite agree with "The Wandering Worrier" (letter No. 4178), and am sorry he has written over a *de plume*. The following is a copy of the offending paragraph which appeared in the *R.A.C. Journal* of the 13th: "The question of the holding of motor cycle competitions on the highway on Sunday has been brought to the notice of the committee of the A.C.U. It wishes to state that it strongly deprecates the practice, and it appeals to clubs to refrain as far as possible from promoting competitions on Sunday, particularly on the highway."

Evidently the A.C.U. is not allowed by "Anti-Humbug" and others to make any suggestions, or intimate its views or wishes in matters which affect motor cycling generally. It is a pity so many affiliated members have recently appeared to take a delight in restricting the A.C.U. at the slightest provocation. Surely motor cyclists are sportsmen enough to recognise a governing body in a proper manner. If "Anti-Humbug" and other members of his club consider they derive no benefit from being affiliated to the A.C.U. let them dissolve, but first let them also consider how many members would be likely to resign if such a solution took place.

I should like to ask "Anti-Humbug" if the competitions held by his club are really better supported when held on Sunday than if they were held on Saturday; also is it really impossible for him and the majority of the other members to meet at headquarters at, say, three o'clock on Saturday afternoons? Further, is a reliability trial run in a business-like manner, and in a way likely to attract good entries when the riders do not wear armlets, when no timekeepers are arranged for at the destination, etc.? It amounts to nothing. Because the club insists on holding its competitions on Sunday no notices or results are published in the press, and events cannot be properly organised.

ANTI-HUMBUG NO.

SUMMARY OF OTHER CORRESPONDENCE.

"BL 239," who is a motor cyclist with a scattered medical practice, wishes to hear from any qualified man who rides a motor cycle and would become a *locum tenens* from August 28th to September 11th. Any qualified gentleman wanting a fortnight's holiday with payment for his services should write to "BL 239," c/o The Editor, *The Motor Cycle*, Coventry.

EXPERIENCES WANTED.

"H. S." (West Kensington) would like readers' experiences with Triumph, Matchless, and Bat single-cylinder machines, including T.T. patterns.

"AM 1015." Roc twin, especially as to ease of starting with handle.

YOU MUST HAVE

a two-speed gear for pleasurable riding. The ROC has by far and away the largest sale in the world. It is adaptable to all makes of machines. The ROC combinations, live axle, clutch, and two-speed gear with hand starting (car-control), is not only a necessity for passenger work, but is the greatest luxury imaginable for solo use. The time for conversion only occupies a few days from receipt of machine. Riders who have once tried the Roc system would never think of setting out on holiday without it. In the latest type the Roc gear box is mounted on a ball race which gives a remarkable smoothness in running. The same device is incorporated in the well-known 4 h.p. single to 5/6 h.p. twin ROC military models. Write for booklets.

THE SCOTT

NON-SKID MOTOR
CYCLE COVER,

'The alternate steel and rubber studded tyre.'

BRITISH MADE
and

Unsurpassed for strength and durability.

WILL NOT SKID ON WET OR DRY ROADS.

Constructed with rows of alternate steel and rubber studs, which cannot tear out or damage cover by rust—in short, it is a "perfect" tyre, which reduces the risk of puncture and side-slip to a minimum, and makes motor cycling a pleasure on all roads.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—9d. per line of 8 words; minimum, two lines. Name and address must be counted. Thus—

Two lines (16 words or less) costs 1/6
Three lines (24 words or less) costs 2/3
Four lines (32 words or less) costs 3/-

In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Thursday morning, or if sent to London (20, Tudor Street, E.C.), by the Wednesday afternoon previous to the date of publication.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

NUMBERED ADDRESS

For the convenience of advertisers, letters addressed to numbers at "The Motor Cycle" When this is desired, 2d. will be charged for and three stamped and addressed envelopes for forwarding replies. Only the number with the advertisement. Replies should be addressed to "The Motor Cycle, Coventry"; or if it is added to the address, then to the number "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown may deal in perfect safety by availing themselves of the Deposit System. If the money be deposited with "The Motor Cycle," other parties are advised of this upon intimation of the arrival and acceptance of goods, the money is forwarded less a charge of registration. The time allowed for a decision of the goods is three days. For all transactions of £10 in value, a deposit fee of 2s. 6d. is charged. Deposit matters are dealt with at Coventry, and money orders should be made payable to Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and answer to their enquiries are requested to silence as an indication that the goods advertised have already been disposed of. Advertisers often receive enquiries that it is quite impossible to reply by post.

WAUCHOPE'S

ROCK BOTTOM VALUE.

There is a grand distinguishing feature of characteristic excellence in ALL the goods associated with the name of

WAUCHOPE'S

OF 9, SHOE LANE, FLEET ST., LONDON, E.C.

which marks off that establishment as being one where the best interests of the cyclist and motorist are not only receiving paramount consideration, but are, further, most

ABLY AND BRILLIANTLY CONSERVED.

No one to whom motor cycles possess any meaning, or for whom they have any interest, can have failed to note with the liveliest satisfaction that in

MAKE, STYLE, AND CONDITION.

the various models to be had from Wauchope's are

MODELS AND TRIUMPHS

in more than name only. But there is something behind these facts, which claims the attention of the wheeling populace, and makes the name of

"WAUCHOPE'S"

a spell to conjure withal. And this "something" consists in the fact that you can bring your present machine to

9, SHOE LANE, LONDON, E.C.

and have its

FULL MARKET VALUE

duly placed to your credit, just as if it were so much hard cash, handed out straight from the pocket. We have doubtless made big strides in the way of

COMMERCIAL PROGRESS

since Esau carried through his famous transaction in barter, away back in the days when the world was young; but the

BARTER BY WAUCHOPE'S

is something positively unique. For example: You are the possessor of a machine of which in course of time you have become weary. It is perhaps more "in your road" than otherwise, and you would willingly get rid of it if you could do so

ON FAVOURABLE TERMS.

Well, your course, in order to the prompt accomplishment of that object, is

SIMPLICITY PERSONIFIED.

Either call on or write Wauchope's, and you will be offered a selection of guaranteed Machines, comprising such standard names as the

TRIUMPH LIGHTWEIGHT, F.N., RHEON AND MOORE, VINDEC, WOLF LIGHTWEIGHT, VINDEC "SPECIAL," BAT, REX, DOUGLAS, MINERVA, MOTO-REVE, MATCHLESS, QUADRANT, ARIEL, MOTOSACOCHE, PREMIER, etc.,

from which your field of choice is practically unlimited. You need have no fear that your second-hand machine will be ignored; and you may absolutely

TRUST WAUCHOPE'S

to give you the fullest cash credit for your present machine. If you are a lady or gentleman of shrewdness, you will perceive, without persuasion, that at WAUCHOPE'S you are dealing in no ordinary emporium. On the contrary, you are bestowing your confidence where it will be esteemed, and pursuing your enquiries where they will meet with every consideration and courtesy. You will find that

WAUCHOPE'S

are able to serve you to the full bent of your expectation and necessity, under what is conceded everywhere to have proved itself.

A PERFECT ADMINISTRATION.

WAUCHOPE'S,

9, Shoe Lane, Fleet St., LONDON, E.C.

Telephone 5,777 Holborn. Telegrams. "Opificer, London."

A Sign of the Times.**LARGE SALES OF**

the 3½ h.p.

Bradbury

And an unmistakable sign of the times, too. It shows that motor cyclists want the best, and, what is more, that they will have the best.

RECOMMENDATIONS

of users are the most frequent means of making sales, for when a man finds a good thing he is not slow to talk about it. Ask any rider of a **BRADBURY** what he thinks of his motor.

The **BRADBURY** is simple to control, and with a minimum of attention it will do everything a motor cycle should, and a good deal more than many are capable of.

You can put a **BRADBURY** 3½ h.p. at the stiffest hill, and it will surmount it with ease.

Send addressed envelope for the Bradbury Motor Booklet, giving hints to riders, and particulars of the Best British Built Motor Cycle.

Bradbury & Co.

LEEDS.

CARS FOR SALE.

ECLIPSE.—20-32h.p. Darracq, two ignition body, canopy, two screens, perfect;

ECLIPSE.—14h.p. Star, 4-cyl., M.O.V., trance, splendid order; £95.

ECLIPSE.—12h.p. National, 3-cyl., 2-seater, good condition; £45.

ECLIPSE.—6h.p. Siddeley, 2-seater, frame, splendid order; £52.

ECLIPSE.—10-12h.p. J.P., 2-cyl., side chassis, hood, perfect order; £80.

ECLIPSE.—6h.p. Swift-De Dion, 2-seater, hood, excellent condition throughout

ECLIPSE.—9-11h.p. Clement, 2-cyl., M.O.V., excellent condition; £65.

ECLIPSE.—6h.p. Vauxhall, 2-seater, three speeds, reverse, very good condition; £18.

ECLIPSE.—14h.p. Forman, 4-cyl., pressed steel frame; bargain, £105.

ECLIPSE.—10-12h.p. Gnome landaulet, side, splendid order; £92 10s.

ECLIPSE.—9h.p. tonneau car, 1-cyl., ring order; £25.

ECLIPSE.—6h.p. Humberette, 2-cyl., good little runabout; £22 10s., bargain.

ECLIPSE.—7h.p. Pope-Tribune, 2-seater, Engineering and Motor Co., 255, Wandsworth. Phone, 1135 Putney.

28h.p. Delannay-Belleville 7-seated Tourer, hood, wind screen, all accessories, in perfect condition; £400.—Box L5,942, The Motor 20, Tudor St., E.C.

18-24h.p. Milnes-Daimler Car, magneto, six, just overhauled, detachable to 2-seater in exchange, or good motor cycle. Edwards, Towcester.

6h.p. Car, thoroughly reliable, smart, 1908, 2-seater; no reasonable cash offer, change entertained for high powered 4-cyl. car, 137, St. Giles Rd., Derby.

RILEY Car, 9h.p., 1908, with detachable wheel complete, hood, four lamps, R light, tools, spares; any trial or examination. Flower, 56, East St., Baker St., W.

BARGAINS.—12h.p. Darracq, 5-seater, De Dion-Prunel, 2 or 4-seater, £85; 6 h.p. ette, £39; all in splendid condition; examinations.—Wernick, 244, High St., Leamington.

14h.p. Buchet, 4-cyl., three speeds and axle, tonneau body, coil ignition, good running order, tyres very good, 810 and spares; £55 for quick sale.—Lieut., Sevenoaks.

8-10h.p. Progress Car, 2 cys., three speeds, really good condition, smart little climber; take good 2½ or 3h.p. motor cycle, or sell £65.—Tullis, c/o Williams, Lancashire.

4-SEATED Car (Decauville), 2-cyl., cardan drive on top, four speeds and reverse, grooved tyres, two spare covers, non-skid plate with lamps, in perfect running order and tried any time during the next two weeks. Rochester Rd., Earlsdon, Coventry.

1908 6-7h.p. Laurin and Klement (more), 2-cyl., magneto, thermosyphon, new, little used (by myself only), smartest, reliable 2-seater on the road, hood, spare nearest offer; good allowance for motor cycle.—Stanton, 619, Lea Bridge Rd., Leyton.

INSURANCE.

PLEASE Send for full covering Motor Cycle Insurance from 18s. 6d. per annum.—Bass, 11, Ongar.

INSURANCE for Motor Cycles of every description arranged by Hugh J. Boswell, Insurance Broker, 28, 6d.; third party, 7s. 15s.; please write for particulars.

LOST AND FOUND.

CAMERA Lost on Sunday, August 8th, 1908, Sussex; finder rewarded.—19, Lessing Common.

FINANCIAL.

R.O.M. Tyre Shares.—50 £1 fully paid preference shares for sale at 45s. each, or would sell part. The increasing reputation of the company's tyres is phenomenal, and, with a small capital of the company, the shares are worth a much bigger price by the time they are sold.—Letters to D., 14, Dysons Rd., Upper Middlesex.

BUSINESSES FOR SALE.

THRIVING Cycle and Motor Business, good living profits, country market, whole concern £120, or offer; part purchase if desired.—Particulars, 96, Ridgway Gate, London.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

Hotel Accommodation and Charges.

ONE of the oldest motor cyclists in this country, and probably one who has toured on a motor cycle or car for as many miles as anyone we know, has just addressed a letter to us regarding the difficulty he experiences in finding hotels to suit his pocket. He says he finds all the R.A.C. and M.U. officially appointed houses too expensive for his means, and avoids them. He further adds that he thinks something should be done to enable motor cyclists who do not want the expensive class of hotel to be in a position to readily find in each town an hotel where the prices are moderate and the comforts equal to those obtainable at home. There is something to be said for our correspondent's grumble. The motoring bodies have certainly annexed all the best hotels in the country, and if one is not prepared to pay tip top prices it is often difficult to find suitable accommodation. Before the days of motor touring cyclists often experienced the same difficulty, and the C.T.C. came to the rescue, and fixed reasonable tariffs at many of the best hotels in the country. That tariff is still in existence, but in many towns the once well-known sign of a wheel and wings has been pushed out by the more ornate and imposing notices of motor clubs. Our friend makes a suggestion that in this lies a chance for the A.C.U. to distinguish itself by collecting information regarding hotels, inns, etc., and publishing it for the benefit of its members. Those who can afford top prices and want corresponding luxuries will, of course, continue to use the officially appointed houses of the R.A.C., etc., but we agree with the writer of the letter that there must be in every town and village well-

conducted hotels and inns where the motor cyclist would be welcomed and where the prices have not automatically ascended with the advent of the motor. We recommend the suggestion to the bodies which are endeavouring to attract motor cyclists to their ranks, and shall be glad to render any assistance which lies in our power. It ought not to be a difficult matter to collect the required information, as local clubs always know where suitable accommodation can be had.

The Use of the Carrier.

WE are sorry to notice a growing tendency to make use of the rear carrier for the purpose of carrying a passenger, and trust it will not become abused. The carrier was in nine cases out of ten never intended to support so heavy a weight as a passenger, neither is the practice likely to improve the machine. Except in the case of an expert rider, it is not over safe, and sooner or later an accident may take place, due to placing a heavy weight directly over the back wheel, which tends to upset the stability of the machine. In some cases, from what we have observed, the machine is thrown considerably out of balance, and consequently the steering is materially affected. It does not look nice to see two riders on a machine constructed to carry one, and always gives, to our mind, the impression of extreme insecurity and a certain amount of discomfort, although one who has tried it assures us that a motor bicycle is more comfortable to ride, owing to the extra passenger's weight holding the back wheel down. An occasional lift to a fellow rider in distress is often expedient, but we deprecate the use of carrier seats as permanent attachments on motor bicycles designed to carry one rider only.

The British Motor Cycle Racing Club.

FIFTH MEMBERS' MEETING.

THE inclement weather experienced last Wednesday came very near to spoiling the fifth of the pleasant members' meetings organised by that young and vigorous body, the B.M.C.R.C. Only two events figured on the programme, and so it was expected that the meeting would soon be over. But at 3 p.m., just when the energetic Reynolds had got everything into working order, the heavens opened and there fell

such a downpour as has not been endured even this wet season. After a little over half an hour the track was in such a condition that no racing could take place, and Reynolds was almost postponing the meeting. However, it looked finer to windward, and so tea was served, and at 4.30 the record time trials began. Though the rain had ceased the weather was cold, and a strong north-westerly wind was blowing, so that the conditions savoured more of April than August.

The men were started at the fork, and taking both the kilometre and mile together, passed through two posts between which were the contact strips at the beginning of each section, so that each man covered

Bentley, Rex Speed King, 82 × 89 mm., 472 c.c.; R. C. Griesbach, Triumph, 84 × 86 mm., 476 c.c.; O. C. Godfrey, Rex, 83 × 89 mm., 481 c.c.

Class D (for engines not exceeding 750 c.c.)—R. O. Clark, four-cylinder F.N., 55 × 57 mm.,

Francis A. McNab (a fifteen stone rider of a 3½ h.p. Trump-Jap) leading Evans and Wells on the two Indians in the hour race.

540 c.c.; L. C. Munro, two-cylinder N.S.U., 75 × 84 mm., 742 c.c.; W. H. Wells, two-cylinder Indian, 70 × 83 mm., 638 c.c.; G. Lee-Evans, two-cylinder Indian, 70 × 85 mm., 638 c.c.; G. C. Mead, two-cylinder V.S., 75 × 76 mm., 672 c.c.; M. Geiger, two-cylinder V.S., 75 × 76 mm., 672 c.c.; F. A. Applebee, two-cylinder Rex, 76 × 80 mm., 726 c.c. In this class a curious accident occurred to Munro. He was just about to enter the kilometre when his machine stopped. Thinking it was wet on the magnet (which was most unlikely, as he had protected this important piece of mechanism by means of a copy of the current issue of *The Motor Cycle*), he tried to restart, and after a few minutes discovered that a circular piece of metal had blown out of one of the inlet domes as cleanly as if punched out by a machine.

Class E (for engines not exceeding 1,000 c.c.) had only one supporter, W. H. Bashall, two-cylinder Bat, 85 × 85 mm., 964 c.c.

We hope to give the results on our late news pages.

In the hour race there were four classes. Class B, for lightweights, for engines not exceeding 344 c.c. Classes C, D, and E were the same as in the preceding event.

The starters were in Class B, Steeves and Dayrell, whose machines were supposed not to exceed 110 lbs. in weight. However, both scaled 125 lbs., so the donor of the special lightweight prize, Mr. A. J. Wilson, will be consulted as to their eligibility. In Class C the starters were W. O. Bentley, F. A. McNab (Trump-J.A.P., 85 × 85 mm., 482 c.c.), T. M. Loughborough

F. W. Dayrell (85 × 60 mm. Martin-J.A.P.), who covered 47 miles 1260 yards in the hour at Brooklands last Wednesday, winning Class B.

precisely the same distance. This event was divided up into four classes, and the participants were the following:

Class B (for engines not exceeding 350 c.c.)—D. F. Steeves, two-cylinder N.S.U., 52 × 74 mm., 314 c.c., and F. W. Dayrell, Martin-J.A.P., 85 × 60 mm., 340 c.c.

Class C (for engines not exceeding 500 c.c.)—W. O.

The British Motor Cycle Racing Club.—

(four-cylinder F.N., 50 × 57 mm., 448 c.c.), and R. C. Griesbach. In Class D, R. O. Clark, L.C. Munro,

Undoubtedly the best performance in the hour race was that of H. H. Bowen on a $\frac{1}{2}$ h.p. Bat-J.A.P., for he covered 59 miles 485 yards, beating all the twin cylinder machines.

W. H. Wells, G. Lee-Evans, G. C. Mead, and M. Geiger. Class E, H. H. Bowen (one-cylinder Bat,

84.5 × 89 mm.), W. H. Bashall (two-cylinder Bat, 85 × 85 mm., 964 c.c.), and W. H. S. Sharpe (two-cylinder V.S., 80 × 95 mm., 952 c.c.) Except when otherwise stated, the machines were the same as those ridden in event No. 1.

The start took place at 5.48 p.m. at the fork. All got off well, and at the end of the first lap Bowen was leading, pressed hard by Bashall, while the others went by in the following order—Evans, Wells, Bentley, Geiger, Clark, McNab, Sharpe, Mead, Munro, Griesbach, Dayrell, Steeves, and Loughborough. At the outset the struggle for first place lay between Bowen and Bashall, and for four laps Bashall led. Then Bowen shot forward and maintained the lead throughout, finishing in splendid form. Evans and Clark had a keen fight for second place, but Evans proved to be more successful than his rival.

Results: Class B.—Dayrell, 47 miles 1,260 yards. Class C.—Bowen, 59 miles 485 yards. Class D.—Evans, 56 miles 880 yards. Class E.—Bashall, 43 miles 1,300 yards. In Class C, the best previous performance was by McNab—48 miles 400 yards; in Class D, 49 miles 502 yards by Dee; and in Class E, Bashall, 55 miles 1,576 yards, which, as it will be seen, was not improved upon last Wednesday.

During the race, Munro, who had got over the trouble above referred to with the aid of a puncture repair patch and some rubber tape, stopped to shorten his belt; Griesbach broke his petrol pipe and Clark his oil pump, and Bentley ran out of oil. The latter rider had a pipe from the crank case of his engine to the inlet pipe between the throttle and the inlet valve, which drew in oil with the mixture from the crank case into the upper portion of the engine. This device he declares works extremely well.

W. H. Bashall and H. H. Bowen at speed. The first-named rider covered 43 miles 1,300 yards in the hour, which is 12 miles 276 yards less than on his last hour ride.

Long Distance .. Trial Riding.

By B. H. DAVIES.

SELDOM take part in the long distance trials of the present day for the simple reason that very rigid and complicated regulations have robbed them of their old sporting interest. I have to do things to the second on my working days, and when I take a holiday prefer to be my own master, and go as I please. But no man does more long distance riding as a matter of pure pleasure than I do. I never feel I have been out for a run unless my route carries me well into three figures, and my ideas of motor cycling are very widely removed from the fifty-mile "potters," with a long stoppage for tea and frequent brief stoppages for other refreshments, which pose as "runs" on the programmes of one or two clubs. But long distance riding is exactly the same on principle, whether it is undertaken solitarily for pleasure or under the eyes of officials partly for pleasure and partly in the forlorn hope of a successful pot-hunt. Consequently I am attempting to set down a few notes relating to points some of our younger trials riders are rather slow to grasp.

One of my favourite rides is a 220 mile spin to visit some relations, returning a second 220 miles the next day. It is obvious that when one has got a holiday beginning at 9 a.m. one day and terminating at 5 p.m. on the morrow, in which one prefers to get eight hours' sleep and has 440 miles to cover, any serious delay on the road will sop up all the time intended for family intercourse, and I prepare for these runs as thoroughly as if I were going to try my luck in a twenty-four hours' trial. I have thirty-six hours at my disposal, out of which eight are booked for bed and twenty-two for riding. At the best I have only six hours for social intercourse, and there is no margin for roadside adjustments and repairs.

Chancing Cross Roads.

The night riding is the period in which most competitors are outed from the long distance trials, and so I will commence by stating how and where I have got behind my private schedule in those months when the days are short, and I cover a big slice of my distance in the dark. A fruitful source of delay has been chancing cross roads, instead of dismounting to verify the right turn. This does not matter by daylight; either one will soon realise some feature of the landscape as being entirely new to one or else one will presently encounter a second signpost. At night it is fatal to take a single turn one is not sure of. The road looks extraordinarily different by lamplight, and if it becomes necessary to retrace one's steps one is quite likely to fail to reach the point where the original mistake was made. Hence I never in the

darkness take a turning that I am not dead sure is right.

Lamp Precautions.

My other night delays have been with lamps. Therefore I nowadays never take an untried lamp or lighting accessory on a prolonged night ride. I stick to an old, well-tried lamp, knowing that the burners and the joints are sound, that the water reservoir is clean, and that the glass won't come adrift or the clip of the hinged front fail me. I stick to an ancient lamp bracket of intolerable weight but ample strength. I mount two small generators on a patent tank clip, where I can keep adjusting them; two small generators are a lot better than one big one. I have an ample supply of carbide in my side pocket and two or three good burners, and the burners have been previously tested for a gastight fit in their holder without the aid of red lead or nostrum packings of any sort, while a stylo pen pricker reposes in my pocket book.

Routine Tuning.

Turning to the daylight work, I can immediately class my delays under three heads. Routine matters of tuning up should need no fresh emphasis in these columns, and, needless to say, it is the height of idiocy to face a long distance run against time if the machine is below par in any way, or if any of the more fragile parts, such as contact breaker details or valves, have been neither examined, adjusted, repaired, nor replaced for months. I should not start with an old exhaust valve, old cotters, or without cleaning out the carburetter and oiling the magneto. *Ca va sans dire.* None of these things have ever interrupted my progress for more than a few seconds, because I overhaul the standard vulnerable points of the mechanism some time during the previous week. No, my main blunders have been connected with tyres and belts, and on several occasions had I been running under M.C.C. auspices to Land's End or under A.C.U. control to Plymouth I should have cut as miserable a figure as the rawest of raw novices.

Slowed by Grease.

Tyres cause delay in two main respects. One is in relation to side-slip. Almost any tyre will stand up on certain highways, such as the Great North Road, provided the machine is modern, and it is not desired to appreciably exceed legal limit. But several times I have found myself pressed for time, faced by most treacherous surfaces, and provided with fairly plain treads. To catch up to an impaired schedule under these conditions is never easy and sometimes absolutely impossible. Therefore, for any long distance run against time I now insist on a genuine non-

Long Distance Trial Riding.—

skid for both wheels. They slow you, especially on hills, and more noticeably if they also possess the second quality I am going to describe as essential. But, after all, a twenty-four hours' run is not a timed print, and we must ape the tortoise rather than the hare. The tortoise—in motor cycling—often scoops the gold medal, while the hare is mending a puncture a hundred miles back. So I use tyres of the solid studded or deeply ribbed rubber variety. A rubber tread is pleasanter than an entirely metal one if the roads keep dry and hard, and the studded or deeply ribbed patterns are quite as anti-skidsome as the metal studs.

Heavy Covers.

But punctures have hurried more of my runs than anything else. Often and often one will go three months without a puncture, and then suffer perhaps from ten in the next month. We cannot carry an unlimited kit of spare tubes, and punctures have a loathsome habit of coming in twos or even threes. It is seldom that a hand solutioned repair is absolutely reliable on a fast motor cycle, and good repairs are awkward in either darkness or rain. Hence I use a brace of real thick puddingy covers on long runs, with board-stiff tread, and some nail catchers as an extra safeguard; and now I seldom get delayed by my tyres.

Transmission Trials.

Finally, many of the younger competition riders put too much faith in their belts. A complete spare belt is an essential safeguard. You may start out with a brand new article that is guaranteed for 2,000 miles, and fitted at the correct tension. All sorts of things may nevertheless happen. You may have fitted the fastener screw too near to one side, and within ten miles it pulls out. Your belt is now too short. You have not got a spare length. You screw out your adjustable pulley; and away down in the south-west corner of England you hit some high hills, and your engine pits the exhaust valve, etc., etc. You have therwise forgotten, dropped, etc., some important item of your belt kit—the pocket knife, the drill, the punch, the file. Or it comes on to pour with rain; and your whimsical belt begins that permanent slip which sometimes assails a trusted belt without rhyme or reason, and seems to be incurable for the day. I

invariably carry a spare belt, and if that on the pulleys be rubber, the spare is leather or *vice versa*. I may never need it—so much the better; but if I do it is there, and if my other belt should give out when I am behind time, it only takes a minute to hook up the spare.

Time Lubrication.

I have two points remaining of lesser importance. One is the advantage of time lubrication. On a prolonged stretch of comparatively unfamiliar road, it is impossible to mark the expiration of each twenty miles section. Thus distance lubrication is sure to be inaccurate. Some riders attempt to lubricate by the feel of the engine, disregarding distance altogether. This is all very well if you are a true expert. But if your experience is not consummate, you will occasionally be misled into thinking the engine wants oil when it has plenty slopping about inside. Lubrication will get on your nerves, and before you see home again your cylinder and piston will be most unhealthily caked with carbonised excesses. For the less expert, lubrication on a time basis is a sound dodge. You are averaging about twenty miles an hour; you have a large watch on the handle-bar. Inject a charge at timed periods to coincide with the usual distance travelled on a pumpful. With a standard 3½ h.p. single-cylinder this will be about one pumpful every hour or half a pump every half hour.

A Good Stand Saves Time and Temper.

On such runs one dismounts rather frequently, perhaps, to stretch one's legs, light a pipe, etc. Some makes of stand are very tiresome, and require much operation. There is seldom a convenient kerb on which to rest the footrest. The road is highly cambered, and you dare not leave the machine in the centre of the fairway. You waste two or three minutes hunting for a flat bit of roadway or a prop. Failing a broad based stand with sharpish toes, and quick in manipulation, it is a good plan to use a stand of the drop-leg variety. Last year I carried besides my big garage stand a drop-leg fitted to the near chain stay, which only wanted knocking down by a gentle kick whenever I dismounted. This year I use exaggerated footrests and let the machine lie over on to them. One of these dodges saves time and temper.

MOTOR CYCLE RECORDS.

In view of the recent decision of the committee of the Auto Cycle Union to recognise "Class" records for motor cycles, the A.C.U. Competitions Sub-

committee has passed the following track records made during the year 1909 at the Brooklands racing track at Weybridge:

Class.	Maximum Cubical Capacity.	Rider.	Machine.	No. of Cylinders	Bore. mm.	Stroke. mm.	Cubical Capacity.	Time.		Mile per Hour.	
								For Kilometre.	For Mile.	For Kilometre.	For Mile.
A	275 c.c.	G. L. Fletcher	Moto-Reve ...	2	50	70	274	48.641	79.213	45.990	45.447
B	344 c.c.	No performance	set up	—	—	—	—	—	—	—	—
C	500 c.c.	H. H. Bowen	Bat	1	85	85	482	34.403	56.002	65.023	64.283
D	750 c.c.	G. Lee Evans	Indian	2	70	83	638	34.569	55.640	64.711	64.702
E	1000 c.c.	W. E. Cook	N.L.G.	2	80	94	944	29.465	47.570	75.921	75.678

It is interesting to note, in view of the limit engine sizes in the T.T. Race, that a 500 c.c. single-cylinder

machine has accomplished a better speed than a 750 c.c. twin.

The Royal Automobile Club Lamp Trials.

WE have received this week the carefully drawn up report of the R.A.C. lamp trials, held on the 18th of last month. Only two motor cycle lamps were tested, and as one of these

was illuminated by acetylene and the other by electricity, they cannot be compared. The following remarks occur in the official report:

C.A.V. electric motor cycle lamp.

—Candle-power of naked light, 5.

Consumption, 3.9 watts. Pressure, 4.2 volts. Dia-

meter of front aperture of lamp, 4 $\frac{3}{4}$ in. Weight, 1 lb. 12 ozs. Height of lamp from ground, 3ft. 1in. Range, 78ft. Width of beam at half range at 3ft. from ground, 7ft.; at 4ft. 6in., 7ft. 3in. Distance at which lamp ceased to dazzle, 29ft. Remarks on design and construc-

Vandervell and Co's C.A.V. electric head lamp for 4 or 8 volt bulbs.

tion, fair. Remarks on back reflection, no stray light.

Solar acetylene motor cycle lamp.—Candle-power of naked light,

4.2. Consumption,

.43 cubic ft. per

hour. Diameter of

front aperture of

lamp, 4 $\frac{1}{16}$ in.

Weight, 2 lbs. 7 oz.

Height from

ground, 2ft. 7in.

Range, 51ft. Width

of beam at half

range at 3ft. from

ground, 8ft. 7in.;

at 4ft. 6in., 7ft.

2in. Distance at

which lamp ceased

to dazzle, 26ft.

Remarks on design

and construction,

very good. Remarks on back reflection, stray light

thrown out rearwardly; light issued round rim of front

also reflections from the body of the lamp.

The Seabrook Solar Acetylene head lamp, made by the Badger Brass Co.

A LONG LIST OF SUCCESSES.

WW. DOUGLAS has competed in most of the important 1909 events, and has now a long list of successes to his credit. His performances are all the more noteworthy when

it is considered that his machine is a comparative lightweight of 2 $\frac{3}{4}$ h.p. Below are some of his successes:

A.C.U. Quarterly Trial (100 marks), certificate; A.C.U. London to Plymouth and back (twenty-four

hours), silver medal; A.C.U. Sutton Bank Hill-climb, second; M.C.C. London-Edinburgh and back (forty-eight hours), special gold medal; A.C.U. 1,000 Miles Reliability Trial, silver cup and gold medal; Scottish Five Days' Trials, bronze medal; M.C.C. London to Land's End and back (555 miles), gold medal.

ENTRIES FOR THE TOURIST TROPHY RACE.

THE following is a list of entries received up to the end of last week for the T.T. Race, to be held in the Isle of Man on September 23rd:

Triumph Cycle Co. (3 $\frac{1}{2}$ h.p. Triumph) (holders

H. Reed (5 h.p. Dot, holder of Twin Trophy).

Norton Mfg. Co. (3 $\frac{1}{2}$ h.p. Norton, 496 c.c.)

Noel E. Drury (5 h.p. J.A.P., 680 c.c.)

C. B. Franklin (3 $\frac{1}{2}$ h.p. Triumph).

W. H. Wells (5 h.p. Indian).

W. H. Wells (5 h.p. Indian).

S. C. Perryman (5 h.p. Norton).

R. Ellis (3 $\frac{1}{2}$ h.p. Rex).

F. A. Applebee (Rex).

O. C. Godfrey (Rex).

W. Grinstead, ———

J. F. Jones (3 $\frac{1}{2}$ h.p. Triumph).

W. O. Bentley (3 $\frac{1}{2}$ h.p. Rex).

WHICH IS THE BEST SIDECAR?

WE still continue to receive almost daily the time worn question, "Which is the best sidecar?" So long as the sidecar attachment

remains with us there will always be champions of the different types, for the simple reason that

all have their respective advantages. Last year we gave our experiences with the Montgomery flexible sidecar, but this year we have tested with much success

Mr. Montgomery's latest attachment, the spring wheel rigid sidecar. With this sidecar the steering

rendered exactly like that of a tricycle, and once the driver is accustomed to it all is plain sailing, provided

the weights are properly distributed and speed reduced at corners. From experience we are inclined

to think that a rigid pattern sidecar requires more power to propel it than the flexible type. The chief

advantage of a rigid sidecar is its entire immunity from side-slip. The comfort of the spring wheel is undoubted

QUESTIONS AND REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor St., E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Transferring Ownership.

Would you be kind enough to tell me the fee for transfer of registration numbers of a $4\frac{1}{2}$ cwt. Phoenix Trimo. I am informed it is 5s. for transfer, and another says it is 1s., so I am in doubt.—A.W.

If the machine is registered as a motor cycle (i.e., a motor vehicle not having more than three wheels and weighing not more than 3 cwt. unladen) the cost of transfer to your name will be 1s. If, however, it is registered as a car, it must be paid.

Going Abroad.

I expect to sail shortly for America, and purpose taking my $3\frac{1}{2}$ h.p. 1908 Minerva with me. Would you please tell me if I shall have to pay duty on it, and if so, about how much? Are there any laws to comply with in taking a motor cycle into that country?—H.M.

The amount of duty you will have to pay is forty-five per cent. *ad valorem*. Provided the machine has been in the possession of the owner and in use for not less than twelve months, it may be introduced duty free. A certificate should be obtained from the American consul before departure, stating that the owner is a tourist, and that he is not introducing the machine for business purposes. The regulations vary in different towns and states. The speed limit in New York is fixed at eight miles an hour.

Misfiring in One Cylinder.

Could you aid me to locate a fault in a 1908 5 h.p. Rex with magneto ignition? The back cylinder will not run alone, and will only pick up with front one after running some way. Inlet valves (springs) are same strength, and I get a spark at both plugs, but not very regular in back plug. Motor is bad to start with back cylinder not working properly. Wiring I think is correct: Terminal No. 1 to back cylinder and No. 2 to front.—W. O.

There is no golden rule to find out why one cylinder does not fire. What we should recommend you to do is to examine the moving parts of the magneto, and see that none are worn; also see that the carbon brushes are making good contact. If you can find nothing wrong, and both cylinders do not fire on a strong mixture, try a new plug in the rear cylinder, and if no improvement consult your local repairer.

Dust Choking Gauze.

I have a 1908 Triumph motor cycle, and have considerable trouble by dust getting on to the gauze in the carburetter. Can you let me know how I can avoid this. I find that on a dusty day I have to clean the gauze once in every five or six miles as the motor won't take any air, and consequently I can't get enough power out of it to climb a hill. Do other riders of Triumphs experience this difficulty? Does the dust come from the front or back wheel? I rather think it's the latter.—C.B.

The best plan will be to remove the gauze altogether and clean out the engine more frequently. This is all that we can recommend, as the gauze is bound to get choked up sooner or later, and even before this is the case a good deal of dust passes through. Although we have frequently heard of the gauzes being choked with dust, personally we have not experienced this trouble in a very long mileage.

A Loss of Power.

Kindly inform me as to loss of power in my machine. Engine, $2\frac{1}{2}$ h.p. Noble; carburetter, F.N. spray; gear, $5\frac{1}{2}$ to 1. The machine will not take hills at all; in fact, it slows at the slightest rise, and seems a long time picking up speed on the flat. The compression is perfect. I can stand on pedal for a few seconds, and the pulley wheel cannot be turned over with one hand. I have ground in both valves, fitted new washers, and added weight to float of carburetter; also tried new springs on both inlet and exhaust valves.—G. P.

Without seeing your machine it is exceedingly difficult to say what is the matter with it. However, we should recommend you to try a slightly stronger exhaust valve spring, which may have the effect of increasing the engine speed. Also check the level of the petrol. It should rise to within one-eighth of an inch of the top of the jet. Make sure the carburetter and feed pipe are quite clean, and then turn your attention to the opening of the valves. If there is any wear on the cams, the tappets will not lift the proper amount, and this will affect the running considerably. Also note that the clearance between tappet and valve stem will barely admit a visiting card. Do not gear too high.

Unequal Temperature of Cylinders.

(1.) Kindly tell me why it is that the back cylinder of my 6 h.p. N.S.U. is always so much hotter than the front one? Is this supposed to be right? If not, how can I improve matters? I have recently replaced the two tappet rods with new ones (the old ones being badly worn) so I am getting as much lift as possible. I think, but with no better result.

(2.) Please inform me what my petrol consumption ought to be for this class of machine?—W.S.

(1.) This is very often the case with a twin-cylinder machine. Being shielded by the front cylinder, the rear one is not cooled so well. It may, however, be due to unequal lubrication, so try oiling more frequently, but in smaller quantities. Is the compression of the two cylinders equal, and does the opening of the valves in each case correspond? (2.) Your petrol consumption might be anything between sixty and eighty miles to the gallon. If it exceeds this, check the level, and try more air or a smaller jet.

Passenger Attachments.

I have a 5-6 h.p. twin-cylinder Peugeot, and would like to buy some arrangement to carry a passenger, but I find myself in difficulties, for I do not know what to get—a sidecar, forecar, trailer, or couplings. Sidecars, I have heard, are very difficult to steer, and also that they are very hard on the engine. Forecars, besides heating up the engine very much, have the disadvantage of making one lose time when attaching it. Trailers, also, have their disadvantages. Firstly they are not a comfortable seat for passengers, and also are dangerous while turning corners.—B. L.

If your idea is to purchase a passenger attachment, for use only occasionally we personally feel more inclined towards the sidecar. Though the steering is strange at first, if the sidecar is properly attached, it becomes quite easy after a little practice. You are wrong in supposing that sidecars damage the engine or machine, and probably fewer disadvantages are experienced with this type of attachment than with any other. You may give up the idea of attaching and detaching a forecar each time you would want to use it. It takes too long. Trailers we should place last on the list you give.

Respecting a Second-hand Tricar.

? I have just purchased second-hand a $4\frac{1}{2}$ h.p. water-cooled Rover tricar. (1.) There is no extra air fixed, except on the induction pipe, and I have to stoop down to reach it. Is it necessary to use this, and should I have a Bowden cable attached with a lever on the tank? (2.) About how many miles an hour should it travel? (3.) Is it wrong when you wish to cool your engine going down hill to switch off, put it out of gear, and open throttle full, or should I shut the throttle. (4.) About how many miles should you run before there is need to scrape carbon deposit off head of piston and grind valves in? —G. D.

(1.) Whether or not it is necessary to use the extra air inlet can only be found out if the engine gives more power when it is opened. If it does, you can easily have a Bowden cable fitted to work it, as it is necessary for all extra air inlets to be closed for easy starting. (2.) The machine should travel at a maximum speed of twenty-eight to thirty miles an hour, and an average of about twenty to twenty-four miles an hour. (3.) The best way to cool the engine downhill is to close the throttle. It is not necessary to switch off and open throttle, as this causes waste of petrol. (4.) There is no way of telling exactly how many miles, but when the engine begins to pre-ignite, lose power, and get hot, it is time to take the cylinder off and scrape away the carbon deposit. It usually happens with an air-cooled engine every 1,000 to 1,500 miles, depending on the quality of the oil, the heat of the engine, and whether there are gauzes in the carburetter to arrest the dust.

Various Queries.

? Kindly furnish me with information on the following points: (a) Best route from West Hampstead to Oulton Broad. (b) Should machine to be used ($3\frac{1}{2}$ h.p. 1909 Humber, two-speed) surmount all hills encountered en route with sidecar and passenger without any difficulty (weight of passenger and driver 19 stones, no luggage)? (c) Could the journey easily be accomplished in a day, starting 6 a.m.? (d) Is flexible or rigid car preferable, and which is the easiest to drive? (e) Does it hurt machine at all to start by handle and low gear from a standstill, or is it better to run alongside and start from high gear? —H. H.

(a) Your best route would be as follows: Hampstead, Finchley, Barnet, Hatfield, here turn right and go through Hertford, Ware, and on through Puckeridge, then take the right-hand fork and continue straight on till you reach the Coach and Horses Inn, here turn right and follow the Newmarket Road, and proceed to the latter town (ten-mile limit); after reaching the furthest extremity of the ten-mile limit, turn right and take the Bury St. Edmund's road, going through this town, Ixworth, Scole, Harleston, Bungay, where turn right and go through Beccles and along the Lowestoft road until Oulton Broad

is reached. (b) The machine should take all hills on the road. There is only one at all serious, and that is at Wade's Mill, which the machine should do easily on the low speed (gradient not exceeding 1 in 12). (c) The journey can be easily accomplished in a day. (d) It is a matter of personal taste. Some riders prefer the rigid and some the flexible. The former steers like a tricycle, and once the driver is accustomed to it possesses the advantage that it will never skid. (e) There is no reason why you should not start on the low gear from standstill; it certainly does not hurt the machine, or the makers would not fit the device.

Misfiring at Speed.

? Can you help me with the following? My engine is a 5 h.p. Humber tricar, single-cylinder, water-cooled, automatic inlet valve, Bosch magneto ignition. Engine starts well with ignition quarter-advanced, but when I advance to threequarter misfires badly. On the road the engine pulls well, but will not accelerate beyond a certain pace, and when I am running down a hill the car over-runs the engine altogether, and the firing will completely stop, and if

A new pattern Peugeot engine for motor cycles. Dimensions, 84 x 86 mm., with mechanically operated overhead inlet valve.

I see another hill ahead I have to apply the brakes on the level so as to get the engine to commence firing in time to ascend the next hill. When declutching I do not need to throttle down, as whenever I pull out the clutch the engine will misfire, and will not go beyond its former speed. The engine does not misfire if I am on a long gradual rise, but will gradually accelerate until I have the spark advanced to the full. If I were to declutch the engine would at once commence to misfire, and would not accelerate. I have

tried decreasing the inlet valve 1/16 in. I have also strengthened the inlet valve spring by putting 1/16 in. washer on below the nut. The inlet valve and exhaust valve springs are fairly strong. I may say that occasionally the engine will behave all right, and will accelerate, but that is the exception.—D.G.

You do not state in your letter if the engine is apt to knock. If it does seem to indicate that the ignition is too far advanced, the result is that it ceases to fire when the advance lever is set forward beyond a certain limit. You had better get the Bosch handbook and check the timing with the makers' instructions, and if the points are breaking properly when the magneto is advanced, you had better write to the Bosch Company and see what they recommend you to do. It is just possible that the trouble may be due to carburation, the engine not getting sufficient air when the spark is advanced. We presume the magneto you fitted was a new one? If it was not, it is possible that the contact breaker mechanism is somewhat worn and some small replacement may be necessary.

READERS' REPLIES.

Refusing to take Air.

On re-reading the issue of the 14th ult., I notice an appeal from "W. L. G." for advice re his 1909 Triumph, which refuses to take air. Having experienced exactly the same trouble with my Triumph (1909), which continued to misbehave after I had cleaned everything cleanable. I at last found that the Bowden wire from the gas lever had stretched and the carburetter was giving hardly any charge at all, owing to piston not being raised high enough. If "W. L. G." will remove the air piston from the carburetter, and with his finger feel the gas piston in the carburetter, at the same time moving the gas lever, he will soon know if the length of wire is at fault.—WM. W. H. EDWARDS.

Leakage past Valve Seating.

We notice in *The Motor Cycle* of August 11th the letter from "F. M." respecting the difficulty he is experiencing in getting proper compression. In your reply you express the opinion that the washers used may be too hard. We would, however, be glad if you would publish the information that there should be no washer between the valve seating and the cylinder. It is possible that the bolts holding the seating are bent, and thus do not hold the faces true. We have also had cases where the seating has been strained owing to a washer having been used and not compressed equally. The seating, as you point out, should be screwed down as carefully as possible, screwing up each nut alternately. We think it would be better for "F. M." to return the cylinder to us for examination, if the remarks do not assist him out of his trouble. We would add that the cylinder is evidently one of our old pattern.—WHITE AND POPPE, LTD.

A heavyweight rider says,
referring to the "Zenith
Gradua":

"I am absolutely satisfied with it, as it will take me up any hill without trouble, and I have gone out of my way to find bad hills. The gear is wonderful, and the manner it enables one to pick up speed or to climb hills has to be tested to be believed. My weight is 16½ stone, and as I always carry a packed carrier-bag in addition to a very complete outfit of spares, there must be at least 18½ stone on the machine."

Another customer writes:

"The points which I especially admire are—

- (1) The "Gradua" Gear which cannot give any trouble.
- (2) Ease of control in traffic."

SRJ

How Hills are Climbed in Big Trials.

One or two correspondents have complained to me that they own duplicates of the machines which competed in the 1,000 Miles Trial, that the medal winning machines climbed Wenlock, Birdlip, Festiniog, and other hills, whereas the privately owned duplicates could not climb less severe hills. Some of my postal friends write that they have lost all confidence in themselves as drivers, others appear convinced that the trade machines are better riders in the big trials with a very much better tuned edition of their tourist model than is sold to the general public. There is a third alternative to these two solutions which possesses the merit of being the true one. If you were to watch a trade or crackleur rider in one of the trials where dismounts are permitted approaching one of the famous hills, you would see that he has presently got to climb it under your observation, this is what you would see. He would dismount some little distance from the foot of the hill, and would remove the jet and choke tube from the carburetter, inserting a larger jet, and probably might fit a choke tube of larger size. If a lightweight rider, he probably will have no need to alter his gear unless a terrific wind happens to be blowing right down the hill. But if he weighs 12 or 13 stones he will open his adjustable pulley, and either tighten the fastener or remove a bit of belt ordinarily bolted up between a brace of fasteners, or possibly change to a fresh belt of narrower section. Then, geared down to 5½ to 1, according to his weight, the severity of the hill, and the size of the boss on his crankshaft, with a carburetter adjusted to supply a large quantity of rich explosive mixture, he will soar up the hill like a bird. When safely over the summit the jet, choke tube, and gear will be refitted in less than five minutes. Some such proceedings are employed by practically every successful rider of medium powered machines in the big trials. The two-speeders and more powerful machines often have such a reserve of power that they do not need five minutes' faking before Birdlip.

Are such adjustments Fair?

There follows the pertinent question whether such adjustments are unfair; whether they delude the public as to the hill-climbing capacity of the machines that are sold? I do not know whether the A.C.U. applaud such practices or wink at them. If they wish to stamp out, it is easily done, by timing each competitor over three or four miles of level road before the hill is climbed. This was done at Dinas Mawddwy, with the motive I know not, but the precaution was foiled because there was nothing to prevent a man making his adjustments three miles past the first timekeeper, and still covering his four miles in the fifteen minutes allowed. If these three miles had been a compulsory carefully observed non-stop, the adjustments would

have been useless, because most motor cycle engines would fail on a hill like Dinas after three miles on a low gear with a big jet. Personally, I regard the tuning as fair and permissible, provided no secret is made of it. A machine which could climb Dinas in ordinary condition on the run, without any preliminary adjustment, would be one of three types—either it would be a low compression two-speeder, or else it would be a machine of rather higher horse-power than most people want, or else it would not suit ordinary country so well as the standard machines of to-day. If the A.C.U. compel such hills as Dinas and Birdlip

The result of a bad collision to a Midget Bicar. The strength of its sheet steel frame is amply proved by the effect of the impact, for, while the frame appears to be undamaged, the fork stem and wheel are very badly buckled.

to be taken without special adjustments in the course of, say, a ten miles non-stop, they will evoke a type of machine we do not want. The man who likes a two-speeder or a twin of high horse-power need never be afraid of straight ascents, however steep. The man who prefers a high geared high compression medium powered single-cylinder engine will not grumble if, before climbing a really exceptional hill, he is obliged to pause for five minutes by the roadside. I therefore describe the universal tactics not in any spirit of blame or distaste, but simply to inform readers who have grumbled to me that they are not so bad drivers or "tuners up" as they fancy, and to show them that they too may romp up Birdlip when their rides take them over that formidable ascent.

The lightweight question is again being vigorously discussed in our correspondence columns, and various opinions have been published with regard to the hills which can be surmounted. As a proof that the Moto-sacoché will take a rider over an average main road in the southern counties without pedal assistance, we may mention the case of Lieut. T. S. Hugh Phillips, who rode from Portsmouth to London and back at a recent week-end minus pedalling gear.

The Swan Electric Runabout.

WHEN the first electric tricycle was illustrated in *The Motor Cycle* last October quite a number of enquiries were received for the agent's address, proving that a runabout of this type finds favour with a large section of our readers. The electric tricycle which is the subject of the accompanying illustrations has recently been put on the British market by the Swan Electric Traction Co., of 16, Percy Street, Tottenham Court Road, W.

The electromotor over the front wheel of the tricycle. The drive is by a telescopic propeller shaft.

The car has been known in Germany as the Berliner or Harborn electric runabout; the British company will be known as the Swan Electric Traction Company, and the machines as the Swan runabouts.

The car is a three-wheeler, the single front wheel being both driven and steered, while the back wheels are merely trailers. Behind the two-seated body is a large box or boot containing the battery of accumulators, which are designed to give a range of about fifty miles on ordinary roads. The battery consists of twenty cells, having a capacity of 120 ampère hours. The current from the battery is taken to an electric motor, which is set with its armature shaft nearly vertical above the front wheel, which it drives through a reducing spur gear and a cardan-shaft with a final drive through bevel gear to the front axle.

The controller is placed to the right of the driver, the necessary movements being made by a side lever. Only one speed forward and reverse is given, but the controller has four steps, so that the resistance is cut out gradually when starting. The connections to the motor and the switch are in the

hollow sloping dashboard, which is an integral part of the plate steel frame.

The arrangement of the electromotor C and the telescopic universally jointed spindle E will be understood from the line illustration. The mudguard is a strongly built structure, which takes the place of the front fork, and its lower ends are connected by two spring steel bars G, which allow a certain amount of freedom, but not sufficient to affect the meshing of the gears F from the motor. The motor itself is of the four-pole type, with plain series windings, and runs at about 1,700

r.p.m. The commutator is placed above it, and is accessible for examination. In the machine brought for our inspection the commutator appeared clean, and showed no signs of sparking.

The vehicles are not intended for general touring work, but rather as town runabouts, and, in view of this, their maximum speed is not much over fifteen miles per hour,

though they can be given a speed somewhat in excess of this for short periods when required for trial driving. The car is steered by tiller, and the control consists entirely of the side lever and a brake pedal, which also automatically cuts off the current.

The back portion of the frame is mounted on three quarter elliptical springs, and the machine runs quietly, and starts without the semblance of a jerk, simply gliding gently from a standstill. By a slight modification in the design of frame a motor van body can be fitted for business purposes.

Section of the motor and driving mechanism.

The Swan Electric Tricycle. The accumulators are stored under the passenger's seat

An Attempt on the End-to-end Record.

A NUMBER of readers will doubtless have heard that Tom Peck made a most plucky attempt to beat the End-to-end motor cycle record last week. Luck was not with Peck, as he was again doomed to failure. This rider has made one or two attempts recently, but it is only fair to the Rex Motor Mfg. Co., Ltd., the makers of the machine he rode, to point out that last week the failure to beat the previous best performance was not due to the machine or its accessories. Peck simply experienced the hardest of luck, as anyone who reads the following will agree.

On his first record ride of 40h. 38m., Peck started from Land's End, but he elected to start from John-o'-Groat's on the last occasion and ride southwards. He was timed away from Wick by J. Robertson, but double commenced early, for while travelling at a fair pace he fell in descending Berriedale Hill, owing to his wheel slipping in loose sand at one of the bad corners. This fall ultimately caused his retirement, for he had broken a bone in his wrist, but was quite unaware of the real nature of the accident, although the wrist was extremely painful, as can be readily understood. Through his inability to steer properly he unfortunately fell again at Lanark, but with extreme luck and determination he stuck to his task, and it was not until reaching Tewkesbury that the wrist was medically examined, when Dr. Elder of that town, at Peck's request, placed the wrist in a plaster cast to enable him, if possible, to continue the journey. According to Peck's schedule, Tewkesbury is 642 miles from John-o'-Groat's, and he arrived there at 4.40 a.m. on the morning of Tuesday, August 17th, having left John-o'-Groat's at 4.2 a.m. on the previous day. At this point Peck assumes that he was half an hour in front of the previous best.

Continuing through Gloucester, he managed to reach Berkeley Road—a point about thirteen miles from Gloucester on the main road towards Bristol. Here the pain of his wrist was so great that he found he could not grasp the right bar properly, and most reluctantly gave up. In record runs naturally the speed is very high on deserted stretches of roads, which necessitates the handles being gripped firmly in rounding corners. Peck managed to steer his machine back to Tewkesbury with one hand, where he had the injured wrist re-dressed and put in a splint, and afterwards actually rode the machine gently to Coventry, where he called at *The Motor Cycle* offices to explain his extremely bad fortune. We examined the seals which we had placed on the machine the previous week, and found them to be intact. The wires to which

the seals were attached were then cut and the cylinder and carburetter removed, and we were thoroughly convinced on examination that the machine was capable of completing the run if the rider had been able to do so. Incidentally, we may mention that the Rex Motor Mfg. Co. recognise that the performance is only an attempt on record, and are merely desirous of giving the lie to any rumours that may gain currency that the machine was the cause of Peck's retirement. It was really a most plucky performance to motor cycle from Berriedale (Scotland) to Berkeley Road (Glos.) in the time taken by Peck. It is not only a remarkable feat of endurance, but to ride with a broken bone in one's wrist, which was rapidly causing the arm to swell and give extreme pain, is one of those instances of bulldog courage for which Peck is noted.

Below will be found some particulars of times of Peck's arrival and departure at various points on the route:

John-o'-Groat's.—Left 4.2 a.m., Monday, August 16th. Starter, Mr. J. Robertson, of Wick.

Inverness.—Telegram handed in at Tain at 9.32 a.m. addressed to Rex, Coventry: "Peck ahead of time here. Signed, Ross."

Telegram handed in at Inverness at 10.40 a.m. addressed to Rex, Earlsdon, Coventry: "Peck left here 8.45. Signed, Balace Hotel."

Telegram handed in at Perth addressed Rex, Coventry: "Peck left 12.46 p.m. Signed, Lindsay and Fenwick."

Telegram handed in at Lanark at 4.16 p.m. addressed to Rex, Coventry: "Peck left four o'clock. Had accident front wheel; straightened same. Wired Chinn, Kendal, procure another. Signed Cox."

Telegram handed in at Kendal at 8.22 p.m. addressed to Hall, Coventry: "Peck left here eight o'clock. Signed, Chinn."

At Warrington the telephone was requisitioned. Here Jones and Huggetts (Liverpool) and Harold Williamson, of the Rex Co., telephoned to W. Williamson at Tewkesbury that Peck had left Warrington at 11 p.m.

At the Bell Hotel, Tewkesbury, he arrived at 3.40 a.m. on August 17th, and was examined by Dr. Elder, who bound his arm. He left at 3.55 a.m.

A belt-driven motor tricycle which was on the road about 1900. It had rear belt transmission, spring frame, Akerman steering, exhaust valve lifter on the handlebar, and drip feed lubrication. This machine, including engine and coil, was constructed by Glover Bros., Spon Street, Coventry, who have an accumulator charging and motor repair works.

Police Traps.

A police trap is working through the villages of Gomshall and Shere in Surrey, and the trap up Guildford High Street is at present in active operation. We have also received rumours of a trap up Hospital Hill, Guildford.

Appointment of Timekeeper to the A.C.U.

Capt. R. K. Bagnall-Wild, R.E., was, at the last meeting of the A.C.U. Competitions Sub-committee, appointed official timekeeper to the Auto Cycle Union for the electric chronograph at Brooklands.

A Medal Winner.

C. E. Murphy, who broke the Irish End-to-end record last week on a $3\frac{1}{2}$ h.p. Triumph, has been declared winner of the special gold medal offered by *The Motor Cycle* to the M.C.U.I. Ulster Centre in connection with the End-to-end Ride, which took place on the 13th ult.

A Victorian T.T. Race.

The annual 100 mile road race of the Victorian M.C.C. was contested on June 7th. There were twenty-three starters, comprising five machines of $2\frac{3}{4}$ h.p. and under, fourteen $3\frac{1}{2}$ h.p.'s, and four 5 h.p. machines. The first two-riders started from the same mark, and got home within $\frac{1}{4}$ m. of each other. The result was: 1st, C. L. Stevens (Triumph), time 2h. $32\frac{1}{4}$ m.; 2nd, H. A. Tilburn (N.S.U.), 2h. $33\frac{1}{2}$ m.; 3rd, A. Milledge (Triumph), 2h. $37\frac{1}{2}$ m.; 4th, E. H. Jenkins (Triumph), 2h. 32 m.; 5th, J. R. Duigan (Peugeot), 2h. $31\frac{1}{4}$ m.; 6th, C. S. Cox (Peugeot), 2h. $52\frac{3}{4}$ m.

Motor Cycles at the German Manœuvres.

Some 120 members of the German Motor Cyclists' Association will take part in the Imperial German manœuvres in Württemberg from September 12th to 17th. They will receive 30s. a day as compensation, with a third-class railway pass for the journey to and from the scene of the manœuvres, the pass including also the free transport of machines. Moreover, the Association insures them against liability and accident. The volunteers employed at the end of July in connection with reconnaissance operations in the vicinity of Frankfurt made a very favourable impression on the military authorities. At the autumn manœuvres, too, of the 9th army corps in the Grand Duchy of Mecklenburg-Schwerin from September 4th to 19th, an extensive use will be made of motor cyclists for orderly and reconnaissance work.

The Six Days' Trials.

The official results of the Six Days' Trials stated that R. W. Duke ($3\frac{1}{2}$ h.p. Triumph) dismounted on Blaenau Festiniog Hill. Mr. Duke disputed this statement, and a letter from the secretary of the A.C.U. states that the committee in conference with the judges have again looked into the matter. Further evidence having been forthcoming, they have decided to award Mr. Duke full marks for his performance on Blaenau Festiniog.

The Veto on Pacing Motor Cycles.

German motor cycle makers do not take at all kindly to the contingent prospects of motor cycles being prohibited altogether on tracks, as they have doubtless learnt much from motor-paced races. Indeed, at a special meeting convened by the Prussian Government to consider the question of motor-pacing (provisionally barred in Prussia in consequence of the catastrophe at Berlin), one of the trade representatives aptly pointed out that the Italian Anzani, who, as a motor designer, shared with Blériot the honours of the flight across the Channel, was originally a pacemaker, and owed much to his early experiences in that capacity. The Government may remove the veto on condition that steps be taken to reduce speed and amply protect the public.

The Woodford to York Run.

The Woodford to York and back run organised by the Essex Motor Club which is to start from Woodford at 7 p.m. on Friday next, promises to be a successful affair, as a good many entries have been already received. The competition has been most carefully arranged, and the timing arrangements have received particular attention. No competitor who has been delayed by trouble on the road will be allowed to make up time, and everyone will be compelled to stop an hour at Grantham. The time for each half of the journey will be eleven and a half hours. The competitors are due in York at 7 a.m.

Damages awarded to a Motor Cyclist.

A Scotch rider named Simon MacLean, of Inverness, was recently awarded £2 10s. damages against the owners of a horse which was being led on the road, but was not sufficient under control inasmuch that as the rider was about to pass the animal turned right in front of him, and had no time to stop. In consequence there was a collision resulting in the motor bicycle being damaged. The man who was leading the horse was undoubtedly at fault, because he ought to have been between the horse and the passing traffic, so that in the event of the horse shying it would have turned away from its leader.

American racers on the new Stadium at Springfield, Mass. (the home of the Indian motor cycle) which was opened on July 31st before 4,000 spectators. A correspondent says that Americans consider the Springfield track the fastest of its kind in the world.

NEWNHAM

HILL-CLIMB.

THE ZENITH-GRADUA HAS A DAY OUT.

THE Coventry and Warwickshire Motor Club was again favoured with pleasant weather for its third annual open hill-climbing competition for motor cycles, which took place on Saturday last at Newnham, near Daventry. One or two slight showers of rain laid the dust, and made the conditions

ment against the inclusion of a corner in a hill-climbing competition, because if the speed of the machine be too great to allow the corner to be turned in safety, speed should be reduced until it is safe. Herein lies the skill, nerve, and judgment of the competitor.

Special precautions were taken to safeguard the competitors and the public. The corner was strongly protected by posts and ropes, and six constables were requisitioned to see that spectators did not impede the riders on the hill.

The weighing-in took place at Reynolds's Garage, Daventry, from 11 a.m. till 1.30 p.m. All machines were inspected at the scales by a committee of scrutineers, who also measured the gear ratio of each machine, which was not allowed to be altered after inspection. The committee also passed all machines entered for Class I. (touring machines). It speaks well for the loyal manner in which the competitors adhered to the regulations, as there were only two whose mounts failed to pass the scrutiny; they were permitted to compete in Class II.

The competition was announced to start at 3 p.m., and within a few minutes of the advertised time Mr. J. L. Norton opened the ball, followed at one-minute intervals by the remainder of the competitors in Class I., whose respective positions on time and on formula are given in the table on next page.

A scene in Reynolds's Garage, Daventry. Basil H. Davies (left) and Gilbert H. Spier (right) who, with the other scrutineers, inspected every machine at the scales.

most favourable for competitors and spectators. This year a shorter course was laid on the steeper portions of the gradient, the approximate length of the climb being 400 yards, which included 166 yards with an average grade of 1 in 6½.

In deference to the loudly expressed wishes of some of the competitors, the bend at the top was excluded, but we must confess that to us this objection was inexplicable. Several similar competitions have been held on hills in various parts of the country, and in many cases corners have been negotiated at speed—corners which are much more abrupt than the one at Newnham. The objection that it is necessary to switch off power before turning is not a sound argu-

The three riders of 3½ h.p. Zenith-Gradua machines who between them won seven awards out of twelve. From the left the names are W. H. Bashall, F. W. Barnes, and R. T. Exshaw.

The organisation of the competition worked with commendable smoothness. Every official was at his appointed post, and as each rider carried a card up the hill bearing the previous competitor's starting time,

Newnham Hill-climb.—

the cards were merely handed to the auditors at the summit, who obtained the finishing time from the time-keeper, made the necessary subtraction, filled in the nett time, and worked out the formula results while the competition was proceeding. The result was that the placings of Class I. were known during the tea interval, and those of Class II. before 5.15 p.m.

Results.

The result of Class I. on formula was a distinct score for the Zenith-Gradua machines, with their infinitely variable gear and J.A.P. engines, as they lifted five awards out of six, fastest time going to the twin-cylinder Indian, cleverly ridden by Guy Lee Evans. There was no doubt that the actual position of the starting point was disconcerting to some of the competitors, who had prepared for a lengthy course of easy gradient in which to get up speed, but if at every hill-climbing competition competitors require an easy start, a well-known hill without corners, and unlimited previous practice, the event loses all sporting interest, and greatly favours those who reside in close vicinity to the chosen hill or possess ample leisure and money to enable them to journey to the spot some days prior to the event.

CLASS I.

Name and machine.	H.P. on club formula.	Position on formula.	Position on time.	Difference in time of ascent in secs
R. T. Exshaw (Zenith-Gradua)...	3.7	1	11	4.8
W. H. Bashall (Zenith-Gradua)...	3.7	2	5	2.6
F. W. Barnes (Zenith-Gradua)...	3.7	3	14	5.2
R. Lord (Rex) ...	3.69	4	7	3.6
G. E. Stanley (Premier) ...	3.7	5	3	2.2
T. H. Tessier (Bat-J.A.P.) ...	3.7	6	15	5.4
Geoffrey Smith (Triumph) ...	3.63	7	13	5
Roy. W. Walker (Premier) ...	3.7	8	17	6.2
J. Marshall (Triumph) ...	3.63	9	9	4
R. Samson (L.M.C.) ...	3.68	10	6	3
J. L. Norton (Norton) ...	3.62	11	10	4.6
C. Cross (L.M.C.) ...	3.68	12	3	2.2
F. Smith (Triumph) ...	3.63	13	8	3.8
R. H. Edwards (Triumph) ...	3.63	14	11	4.8
R. M. Brice (Brown) ...	3.7	15	19	6.8
W. Creyton (Triumph) ...	3.63	16	16	5.8
W. H. Wells (Indian) ...	4.96	17	2	1.2
G. Lee Evans (Indian) ...	4.96	18	1	X
S. Davis (Rex) ...	3.56	19	23	10.2
R. W. Corah (Corah) ...	3.7	20	20	7.2
E. A. Gorton (Rex) ...	3.74	21	26	12.6
W. W. Douglas (Douglas) ...	3.09	22	25	11.2
H. Teague (Premier) ...	4.33	23	22	9.6
Frank White (Rex) ...	5.74	24	18	6.4
J. Leno (Premo, two-stroke, A.C.) ...	4.4	25	21	9
J. Winslow (Rex) ...	5.74	26	24	10.6

X denotes the fastest time, this being taken as the basis, the figures shown in the last column being the additional number of seconds taken in excess of the fastest.

After tea, which was served in a marquee erected in a field at the top of the hill, the riders in Class II. could be heard warming up their engines preparatory to the uphill flight. In the case of G. Lee Evans (who was fastest) and one or two others who made very fast time, their sensations must have been as near an approach to actual flying as it is possible to get without actually leaving the earth.

On formula the Zenith-Gradua, ridden by its designer, F. W. Barnes, and a private owner, R. T. Exshaw, again scored. A. Mackenzie Cott (7-9 h.p. King-J.A.P.) made fastest time. A touring Triumph ridden by Geoffrey Smith, and W. H. Bashall's 7-8 h.p. King-J.A.P. secured the members' prizes.

CLASS II.

Name and machine.	H.P. on club formula.	Position on formula.	Position on time.	Difference in time of ascent in secs
F. W. Barnes (Zenith Gradua) ...	3.7	1	16	6.6
R. T. Exshaw (Zenith Gradua) ...	3.7	2	22	8.6
J. C. Smyth (Rex Speed King) ...	3.69	3	3	1.6
G. E. Stanley (Premier) ...	3.7	4	4	1.8
H. G. Potts (T.T. Triumph) ...	3.63	5	13	4.6
W. A. Jacobs (Rex Speed King)...	3.52	6	16	6.6
J. P. Le Grand (Rex Speed King)	3.52	7	18	6.8
J. L. Norton (Norton) ...	3.62	8	14	5.8
W. O. Bentley (Rex Speed King)	3.52	9	15	6.2
O. C. Godfrey (Rex Speed King)	3.61	10	6	2.0
W. F. Newsome (T.T. Triumph)	3.76	11	4	1.8
Geoffrey Smith (Triumph) ...	3.63	12	23	9.0
J. Marshall (T.T. Triumph) ...	3.76	13	7	2.8
T. Silver (Quadrant) ...	3.92	14	21	7.6
P. Baker (Electric-Minerva) ...	2.78	15	24	11.0
H. D. Teague (Premier) ...	4.33	16	10	3.8
F. C. Wood (N.S.U. two-speed)	3.82	17	27	20.2
A. Mackenzie Cott (King-J.A.P.)	7.81	18	1	X
J. W. Waring (Minerva) ...	6.58	19	12	4.4
H. Rem Fowler (Rex Speed King)	5.74	20	9	3.2
F. W. Applebee (Rex) ...	5.74	21	19	7.0
F. A. Applebee (Rex) ...	5.74	22	7	2.8
W. H. Bashall (Bat-J.A.P.) ...	7.4	23	11	4.2
G. Jones (Bat-J.A.P.) ...	6.25	24	25	12.0
E. Kickham (Leader-Peugeot) ...	7.04	25	2	1.0
F. G. Bagshawe (Rex Speed King)	5.74	26	20	7.4
W. W. Douglas (Douglas) ...	3.098	27	26	18.6

The heaviest combined weights of riders and machines in Class I. to ascend the hill were J. Winslow (5 h.p. Rex) and R. T. Exshaw (3½ h.p. Zenith-Gradua), who both turned the scales at 402 lbs.

The lightest was W. W. Douglas (2¾ h.p. Douglas), 267 lbs.

In Class II. the heaviest was F. C. Wood (4 h.p. N.S.U., two-speed), 415 lbs., and the lightest O. C. Godfrey (3½ h.p. Rex Speed King), 261 lbs.

Fastest time in Class I. was made by Guy Lee Evans, 4.9 Indian (twin), who won the Silver Cup presented by the United Motor Industries, Ltd. He is depicted rounding the bend at the Barn—gradient 1 in 10.3.

The largest engine used was A. Mackenzie Cott's King-J.A.P., 85 by 95 mm. (1,078 c.c.), and the smallest a 2¾ h.p. Douglas, 60 by 60 mm. (340 c.c.)

The fastest machine in Class II. (A. Mackenzie Cott's 7-9 h.p. King-J.A.P., twin) completed the distance in 2.6s. less time than the fastest machine in Class I. (Guy Lee Evans's 4.9 h.p. Indian, twin).

The fastest single-cylinder machines were J. C. Smyth's 3½ h.p. Rex Speed King in Class II., G. E. Stanley's 3½ h.p. Premier and C. Cross's 3½ h.p. L.M.C. in Class I.

Newnham Hill Climb.—

Mr. F. W. Barnes told us after the climb that he started with the Gradua gear at its lowest (about 9 to 1), and gradually increased the gear to about 4 to 1, lowering it again on the very steepest portion of the

hill to 6 to 1. The throttle and spark were left full on from the start, and the engine was always developing full power, because, owing to the variable gear, the number of revolutions could be kept at their maximum—a distinct advantage in hill-climbing.

This picture gives an excellent impression of the scene at the top of Newnham Hill. No. 20, S. Davis, 3½ h.p. Rex, is the rider who is ascending the steepest gradient, 1 in 6½ average for 166 yards. Among other officials at the summit is the Judge, Mr. John V. Pugh, J.P., who is seen standing on the left of the Police Sergeant in the background.

IRISH END-TO-END RECORD.

MR. C. E. MURPHY is no stranger to the Irish End-to-end course. In August, 1907, he rode over it in company with J. Stewart, of Belfast, and in the recent competition for the Palmer & Co.'s trophy he was one of the riders who secured 11 marks, and was only knocked out of the deciding climb by a bit of ill luck. He is one of the most enthusiastic motor cyclists in the kingdom.

Murphy did not follow the course usually taken by end-to-enders. It has been the practice to go into Dublin, chiefly because of the ease of obtaining supplies there; but the more direct route, and the one followed by cyclists in the days of pedal bicycle records, across the Bog of Allen to Navan. Besides being shorter, the roads are better. On this account the time set up by Murphy is hardly comparable with the old records, but as he beat the time credited to A. J. Little in the early part of the present year by nearly 10 hours, and his own figures of 1907 by 2h. 42m., it will be at once seen that his performance was an excellent one. His time was 13h. 6m. for the journey. The only incident of note in Murphy's journey was a series of annoying punctures between Cork and Dublin. He started from the coastguard station at Black Island at 5 a.m. He was clocked there, and also at Cashel, Navan, Banbridge, and at the finish. Murphy's mount was a Dunlop-tyred Triumph, and, as

might be expected, it carried him through in a most satisfactory manner.

C. E. Murphy, who rode a 3½ h.p. Triumph with Dunlop tyres, and created a fresh record for the Irish End-to-end ride on the 16th inst. Mr. Murphy is a member of the Ulster Centre M.C.U.I.

“THE AUTOCAR” LEAGUE.

WITH a view to harmonising the somewhat divided counsels of motorists in regard to matters of public policy affecting their interests, “The Autocar League” has been formed. It is described as “an attempt to band together the whole of the motorists of the United Kingdom.” No subscription is asked, and the only condition imposed is that members will undertake to vote by postcard or letter on any important matter concerning the welfare of automobilism. If motorists see fit to co-operate in this simple way (says our contemporary) the result will be to weld them together and to give them a strength

and weight which they have hitherto lacked. It also hoped by this means to strengthen the hands of existing organisations by putting them in possession of definite information as to the views of the general body of motorists on matters of moment affecting their interests. Our contemporary further adds that the names and addresses of the enrolled members will not be used for any other purpose than that mentioned. We hope that motor cyclists will participate in the scheme, so that motorists generally may present a united front when their interests are attacked. The matter will be dealt with more fully in an early issue.

BRITISH MOTOR CYCLE RACING CLUB.

Results of Record Time Trials at Brooklands on Wednesday last, Aug. 18th. (See pages 630-631).

CLUB NEWS.

North-west London M.C.C. and Oxford M.C.C.

An inter-club hill-climbing competition between the above clubs was held on the 14th inst. at Cop Hill, Princes Risborough, and a better venue for the purpose would be difficult to find. The hill is straight, and spectators on the high banks at the top are able to watch the competition from start to finish. Teams of five riders were selected to represent each club. When the results were worked out on A.C.U. formula the Oxford team proved easy winners, the three best performances being also made by Oxford men. Results:

OXFORD TEAM.

	Total weight. lbs.	Time.	Fig. of merit.
F. W. Barnes (3½ h.p. Zenith Gradua)	380	61.2s.	77.62
G. F. Cooper (5 h.p. V.S.)	344	60s.	117.2
W. Mathews (3½ h.p. Triumph)	320	81s.	120.8
H. F. Smith (2¾ h.p. N.S.U.)	dismounted on 1 in 5 portion.		
H. A. Bishill (3½ h.p. Triumph)	dismounted on 1 in 5 portion.		

F. W. Barnes made the best performance of the day on formula, and also the best combined performance on time and on formula. He took the 1 in 5 portion in fine style.

NORTH-WEST LONDON TEAM.

	Total weight. lbs.	Time.	Fig. merit.
G. Rowden (7 h.p. Bat)	380	52s.	131
— Phillips (5 h.p. V.S.)	348	76.6s.	147
A. Brunton (5 h.p. Rex)	dismounted on 1 in 5 portion.		
— Simpson (5 h.p. V.S.)	dismounted.		
W. O. Bentley (5 h.p. Rex)	did not start.		
G. Rowden	made fastest time of the day.		

Manchester M.C.

On Saturday last the above club held a petrol consumption test for motor cycles and cars. The course was a usual one of twenty-five miles on Cheshire roads, starting from the Nag's Head, Bucklow Hill. Owing to the inclement weather a less number than usual competed.

Motor cycle results.—1, H. Reed (3½ h.p. Dot), 23 m covered, 128 miles to gallon; 2, C. E. Kettle (3½ h.p. Triumph), 22¾, 126.

The next club event will be on September 4th, when hill-climbing competition for motor cycles and cars will be held.

A group of competitors who took part in the Hull and East Riding A.C. Reliability Trial on Saturday last.

Club News.—

North-west London M.C.C.

Will members who are away please notify the secretary if they intend entering for the inter-team competition with the St. Albans M.C.C. on Saturday, September 4th. A very sporting course near Potter's Bar has been chosen, and provided there is a good entry the event should prove most enjoyable. Mrs. C. C. Cooke will entertain the competitors to tea afterwards.

Bristol Bicycle and Motor Club.

In connection with the penalty run recently held by the above club the judges have made the following awards: E. J. Prosser (3½ h.p. Phoenix Trim), 100 points, gold medal

C. L. Stevens (3½ h.p. Triumph) winner of the Victorian M.C.C. 100 Miles Road Race on June 7th. Time, 2 hrs. 32½ mins.

represented by Messrs. Douglas Bros. for best performance by a private rider; Eli Clark (2¾ h.p. Douglas), 100 points; T. R. Mereweather (2¾ h.p. Douglas), 97, 2; F. Bevan (5¼ h.p. Rex and sidecar), 80, 3. Owing to the success of the above event it is intended to hold a reliability trial on the first Saturday in September, over a circular route of about twenty miles, which will be covered four times. Any motor cyclist in the district joining the club by 25th inst. will be eligible to enter. The hon. sec. is Mr. E. J. Prosser, 1, Brecknock Road, Knowle, Bristol.

Wimbledon and District M.C.

The results of last week's speed judging trial was: 1. Eric Lord (3½ h.p. Triumph); 2. A. Warrington (4½ h.p. twin Minerva); 3. G. Aldington (5 h.p. twin Eland). A hill-climbing competition is arranged for the 28th inst., entrance fee 2s. 6d. The club has reduced the subscription to 7s. 6d. per annum, including affiliation. Will any intending member please communicate with Mr. E. A. Roberts, at 33, Griffiths Road, Wimbledon.

Ayr and District M.C.

This season's reliability trial was held on Wednesday, the 11th, over a circular course of 185 miles, starting from Ayr at 6 a.m., travelling to Dumfries, Castle Douglas, Kirkcudbright, Newton Stewart, Stranraer, and home at 8.15 p.m. via Ballantrae and Girvan. The roads were in good order but for a heavy layer of dust and the usual sprinkling of nails, boot protectors, etc. A considerable number of cattle droves in and around Dumfries somewhat impeded progress. Five controls were arranged for, with two secret checks en route, the latter occasioning riders no small amount of anxiety, the tendency for the most part being to rush various stretches and arrive early, owing to the times being fixed on an 18 m.p.h. basis.

Thirteen competitors started, and five finished dead on time at all controls. The others were counted out mostly through tyre troubles, with the exception of a twin rider, who cracked a back cylinder clean in two at the bottom, and another competitor who had trouble through excessive overheating. Gold medals for absolute non-stop runs have been awarded to Matt. Brown (3½ h.p. Bradbury), Chas. Carver (3 h.p. N.S.U.), and Cecil Henderson (3½ h.p. I.T. Triumph). Silver medallists: John Meredith (3½ h.p. Triumph), punctures; and D. Milligan (4 h.p. Werner), sooted plugs.

Mr. A. P. Walker's special prize for the best all-round performance was divided between Messrs. Brown and Carver, Henderson being disqualified for this solely through losing his generator eighteen miles out.

A new motor cycle club has been formed in New South Wales, called the Western Suburbs Motor Club. A start has been made with a membership of twenty-five. The photograph was taken at the top of Lapstone Hill, on the occasion of a run to Springwood and back, a distance of 80 miles.

THE MOTOR UNION HANDBOOK.

The Motor Union has just issued to its members the "British and Irish Handbook," compiled by that body. The new publication is essentially a touring guide, and should be of the greatest value to motor cyclists. At the beginning of the book is a very valuable road map of Great Britain, divided into thirty-two sections and furnished with a key map. The major portion of the volume is in the form of a touring directory of nearly 1,000 places in Great Britain and Ireland arranged in alphabetical order. Under the name of each town are given a useful table of distances, a note of the chief places of interest, the hotels and repairers officially recommended by the Motor Union, the Union's

honorary correspondent and local solicitor, particulars of the toll bridges and ferries in the neighbourhood, speed limits, steamship charges, touring notes, and other useful information.

It is very unusual for foreign-built motor cycles to be fitted with a British-made magneto. Nevertheless, the Simms Magneto Co. inform us that at the Cueno Races in Italy, Borgo motor cycles were first, second, third, fourth, and fifth in Class 1, and Semeria motor cycles second, third, and fourth in Class 2, and all were fitted with the British-made Simms magnetos and sparking plugs.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Silence.

[4211.]-Regarding letter 4181, the tubes can be purchased from Brown Bros., Great Eastern Street, E.C. The valves can be made of sheet iron or brass by a local man. When the valve is set in a certain position it will increase the speed of the machine about 12% as compared with the tube off, but the valve must be adjusted for each speed. I should think that such an exhaust would be just the thing for a two-stroke engine, provided the exhaust port opens a little before the inlet. What does Mr. Scott think.

HENRY GRAFTON.

- [4212.]-I am exceedingly glad you are taking up the question of silence in the case of motor cycles. There is not the slightest doubt that, both at home and abroad (as regards India I speak from experience) the noise made by the average machine does more harm to motor cycling than anything else. The reliability of motor cycles is generally known, and the vibration bogey is being rapidly dispelled, but the noise is indisputable. On nearly every machine there is plenty of room for a large and efficient silencer if manufacturers would only take the trouble to bestir themselves in the matter.

L.B.S.

A Savage Fine and its Result.

[4213.]-I deeply sympathise with Mr. A. F. Jefferies, and should like to take this opportunity of warning other motor cyclists. Intelligent use of a good map will often disclose roads not trapped by the police, and in this instance there is another route, more hilly, it is true, but free from the bugbear of motorists.

As a native of the town where the sergeant (who is in charge of this noted trap) hails from, I am given to understand that he has never worn the uniform of the police force, having gained notoriety and the position of sergeant by these motor trapping methods. WALTER CHARLES.

Sunday Competitions.

[4214.]-I am with "Anti-Humbag No. 2" in agreeing with "The Wandering Worm's" letter, and am also very sorry that he, as well as "Anti-Humbag No. 2," has written under a *nom de plume*.

No one will object to the A.C.U. suggesting that Sunday competitions should not be held, but, on the other hand, it is not nice to have pressure brought to bear to compel one not to hold them.

I do not think clubmen wish to restrict the A.C.U. in its endeavours to do good in any way, only sometimes its endeavours seem a trifle strange, such as pointed out in Mr. W. J. Akerman's letter last week, *re* allotting marks, etc., in reliability competitions.

"Anti-Humbag No. 2" appears to lose sight of the fact that all motor cyclists are not so lucky as himself with regard to Saturdays, and depend principally on Sundays to have a ride. I think he must be one of those riders who like to ride and at the same time advertise themselves with large labels on their machines, and by wearing armlets themselves. When such means attract good entries, I think it is time that other means were found. My experience is that other road users think that a road race is in progress when riders and machines are so labelled.

H. W. BEECH.

Deposit in Cylinders.

[4215.]-I very frequently read in *The Motor Cycle* various remarks as to the deposit which is found in cylinders.

If it is of any service to your readers I shall be very happy to make an analysis—free of cost—of the percentage of mineral matter in any of the deposits which riders may find in their cylinders, provided that the samples are sent through you and that a stamped self-addressed envelope is enclosed with the deposit for the result of analysis.

I cannot engage to make a complete analysis as that would take up too much of my time, but if just the statement as to the percentage of mineral matter is of any use to anyone I am at your disposal.

ANALYST.

An Old Complaint.

[4216.]-Perhaps you could find space in your splendid paper to listen to a little difficulty that presents itself to many motor cyclists in Ireland, and, indeed, I expect, in other countries. Frequently when out riding I have to stop in small towns for petrol. I am invariably informed that I can have a two-gallon can, but cannot have any less.

Now, very few cycle tanks, even when quite empty, will hold two gallons; mine most certainly will not. I have therefore to leave sometimes as much as a gallon and a half behind. This is really very wasteful, and may deter some from going in for the sport.

I am writing in the hope that some enterprising manufacturer may think it worth while to put on the market a one-gallon tin of petrol. Such would be a great boon to many, and would, I am sure, popularise the enterprising manufacturer's brand of motor spirit.

HIBERNIAN.

[Certain petrol firms put up their spirit in gallon cans, but they do not push the sale; in fact, we seldom see one.—Ed.]

The Lightweight Question Again.

[4217.]-On taking up *The Motor Cycle* and turning to "Letters to the Editor" pages, I observe that I am crushed by three gentlemen of more than double h.p. and 25 lbs weight. I have never ridden the Douglas, though it is a machine that I admire very much. Naturally, I should expect a 2½ h.p. opposed twin weighing 100 lbs. to do nearly as much as a 3½ h.p. weighing 160 lbs. The reason why I bought the little lightweight was this. The agent who sold it me had got hold of the theory which wanders round, that for half the weight you only require half the power. (I heard this theory first in 1903 in connection with a 2 h.p. Minerva.) This agent explained the theory so well that he made me believe it, and I bought the machine. Owing to the question of £ s. d., I am still riding it, and still suffering from very doubtful starting, having to nurse the machine up even small hills, and various minor troubles. I have completed 1,000 miles on it, and the only advantages that I can find are the ease of getting it in and out, and the fact that it does not squirt oil over one's trousers.

When I meet a kind friend on a Douglas, I shall try and get him to give me a run, and then perhaps I shall be converted, but until that day I still sign myself

EX-LIGHTWEIGHT.

Lycett's
LYSO

-the leading
Rubber
Belt.

and its Patent Fastener

—included FREE—forms all the equipment necessary for the Motor Cyclist who wants to get the BEST out of his machine.

—You cyclists who prefer the cleanliness and neatness of a Rubber Belt with as little loss as possible of the advantages of a Leather Belt, will find your ideal in this, the LYSO-Belt.

—It is made on the sound lines of the famous RAWIDO Leather Belt; it has the same shape of section, a similar fastener, the gap-less join, etc.; but, it has the intrinsic advantage of a RUBBER body—pure Rubber.

—Further, it has MAXIMUM FLEXIBILITY through the RIBS on inner and outer surface, and MAXIMUM GRIP by means of the SUC-TION HOLES at sides, etc.—a distinct improvement over anything else on the market.

—For the Racer; for the Tourist; for the Business Man; for the Hill Climber; THIS is the PERFECT and essential Belt. It always Grips—never Slips—and conserves the Engine power.

—See what TOM PECK says about it in our Ad. in August 11th issue

—Our price is moderation itself! only

1s. 6d. per foot

for the $\frac{7}{8}$ " size; or 1/10 for the 1", including fastener.

—Please state exact length required when ordering.

A Fortune Waiting in Glasgow.

[4218].—Perhaps you will allow me a few lines in your widely read paper to place a few facts before your readers, and at the same time to bring to the notice of some mechanic the direct road to making money. In this city of ours (Glasgow) there is a want, very much felt by motor cyclists, of a really first-class garage, where motor cyclists can have their machines properly repaired, and secure, when required, parts without having to send to England and elsewhere for them. With our so-called motor garages, should one require certain parts, the usual answer is, "Haven't got them; if you care to wait will send." etc., etc.

I tell you, sir, there is a small fortune waiting for some enterprising firm or competent mechanic who would only give the idea of opening a business of the kind a thought for the requirements of motor cyclists. (Let it be the central part of the city.)

I hope through the courtesy which you generally extend to your readers you will find a small space in your paper for this letter, which may be the means of some firm settling in this city and meeting with the success which the opening of a shop for motor cyclists' requirements would, I am positive, bring them.

The great majority of motor cyclists in Glasgow will bear me out when I say the catering for their requirements in this city at the present time is simply disgraceful.

GLASGOW MOTOR CYCLIST.

Two-stroke Engines

[4219].—I do not think that Mr. McIntyre's letter [4150, July 21st] has successfully cleared up the difficulties raised in my last letter. The motor is apparently a three-port, two-cycle motor, i.e., valveless. The only place where a non-return valve would be of use to prevent a crankcase explosion is in the transfer passage, and there is no sign or mention of such a valve in the design as published in *The Motor Cycle*. [There is no valve in transfer passage, but there are gauzes which prevent flame reaching the crankcase.—Ed.]

With regard to flexibility, I hope to test this practically myself, but I will point out in passing what a very short time the mixture has to charge the lower part of the cylinder compared to a four-cycle engine. In the displacer pump motor, as arranged in the Dolphin car, the time of suction is arranged to be longer than in a four-cycle motor, so that at very high speeds this type of motor would take in a heavier charge, and therefore be more powerful. I admit the inferior mechanical efficiency of the pump motor, but I consider that this is amply compensated for by efficiency in other ways.

There used to be on the market some years ago a two-cycle motor of the type I advocate, called the Bichrone, and if any of your readers have ever ridden such a machine it would be interesting to have their experiences with it.

H. E. RENDALL.

The A.C.U. Quarterly Trials.

[4220].—I hope that next year the A.C.U. will impose somewhat stricter rules and conditions for the Quarterly Trials, and that the judges will be more exacting in allotting marks. At present the results are most misleading to the public. The "perfect" machine that wins the cup may quite possibly do what has actually occurred in the trials without losing a mark—it may finish with a flat tyre, broken exhaust pipe or oil pump glass; it will probably have waited about ten minutes to cool at the bottom of the test hills, and that in a non-stop run. It may be as noisy as anything, with a cut-out open, and yet get full marks for silence; it may take over a quarter of an hour to get the back wheel out, or twice that time to remove the cylinder, and it will get full marks for accessibility. It may want paraffin injections and pedalling on the stand to start, and yet it will get full marks for ease of starting. In fact, the whole system of marks as at present administered is absurd, and fails to differentiate between the many good (but none perfect) machines.

For next year I should like to see a harder course, but certainly something like the following ought to be carried out:

BRAKES.—A test should be made on Stokenchurch hill, and marks lost unless the machine pulls up dead. More marks to be lost unless the brakes are up to date and perfect on an examination at the end of the trial.

SILENCER.—Full marks for a really quiet silencer without cut-out. If cut-out is fitted, allow, say, 7 marks for a quiet

machine when it is closed, about 3 or 4 if it is still noisy (as many are). Tests to be made on full throttle before the judges with the machine on the stand. (N.B.: By the end of next year all competing machines would have a good silencer.)

STANDS.—Marks to be lost for a stand fitted on the back axle; also if it has to be bolted up on the mudguard. A spring holding stand is about perfect.

ACCESSIBILITY.—Any rider obtaining full marks should be able to remove the back wheel in five minutes. The judges should differentiate between those machines whose cylinder is readily detachable, and mark accordingly; if necessary, they should insist on its removal. I do not call a machine accessible if you have to take the engine out of the frame to remove a cylinder.

HILL-CLIMBING.—Any machine should climb both hills at 16 m.p.h. after cooling and rushing. Therefore the hills should be taken hot, and I suggest a stop halfway up Dashwood and a restart, average pace, including the stop, to be 18 m.p.h. This will give an advantage to the flexible engine and also to two-speed machines. (I do not ride one of the latter myself.)

EASE OF STARTING.—Penalise any machine which has to be eased by injection of paraffin or petrol after the luncheon stop, and which fails to start first push of the pedals.

COMFORT.—Give marks for large and efficient saddles, comfortable spring forks, and low footrests. Deduct marks if machines have not these essentials.

MUDGUARDS.—Penalise machines minus belt guards, front wheel side pieces (as the Rex and Humber have), and those without front wheel mud flaps.

CONDITION.—Deduct marks for anything which has broken or come loose in the day's run, and for dirty engines.

RELIABILITY.—Why should a machine which stops on a hill lose marks for hill-climbing and reliability?

These points should be strictly insisted on by the A.C.U. and its judges, and they will help next year to bring out a really good machine and water down the full markers. Instead of getting 100 marks in the last Quarterly Trial, I should with many others have lost marks if they had been differently awarded. I hope to see no "full markers" in the Quarterly Trials next year.

FULL MARKS.

[4221].—Will you allow me in justice to the manufacturers of my machine—the Advance Co.—to point out that although mine was not recorded as a non-stop run in the above trials this fact should not be regarded as detrimental in any way to the machine itself. As stated in the report in *The Motor Cycle*, I was carrying a passenger on the back carrier, and the total weight of machine, passenger, and self was 566 lbs.

C. H. Crole-Rees, who competed in the last A.C.U. Quarterly Trial, carrying an extra passenger on his single-gear 6 h.p. Advance Twin.

On top of this I had to run with a 3 $\frac{1}{2}$ to 1 gear, as I could not then reduce it any lower, it was, therefore, not surprising that I had to drop my passenger on such hills as Dashwood and Rectory.

CECIL H. CROLE-REES.

Touring in North Wales.

[4222.]—I noticed in the description of the A.C.U. Six Days' Trials what a small percentage of single-gear machines successfully climbed Dinas Mawddwy hill. I made a special journey there last Bank Holiday to make an attempt mounted on a 5 h.p. twin Tourist 1909 Rex minus pedals.

The machine was geared 4 to 1 and in full touring trim, and myself weighing 11st. 4lbs. It may interest your readers to know that I climbed the hill first attempt quite clean at a good pace. There was no wind, but the mud was bad in places owing to the rain. I really cannot understand why so many machines failed, as no doubt they would be geared much lower than my machine. I think this speaks volumes for the Rex machine as regards power. I find the plugs soot up fairly frequently, although I drive carefully and use a good oil (Price's A.) Can any of your readers with any experience of the 1909 twin recommend a good plug.

I should like to warn any riders contemplating a tour round Dolgelly as the roads in some places are absolutely unrideable owing to heavy traction engine traffic. I myself had to push my twin up the three miles from Dolgelly to Cross Foxes Inn on the road to Dinas. I trust you will find room in your interesting paper for this warning, as no doubt many motor cyclists inspired by the review of the trials will be making a tour *via* the hill and the above-mentioned road.

FRANK H. CHRINES.

Lubrication.

[4223.]—I am pleased to see that Mr. E. Allan Glen's letter [4165], July 28th, has re-opened this much debated question. If his invention accomplishes all he claims, I should like to see him prove it by demonstration on Brooklands or any other track. It would be interesting to hear whether water-cooled as well as air-cooled oil may be used.

ARTHUR PRATT.

[4224.]—I am much obliged for the interest a number of your correspondents have taken in my oiling experiment, and would like to reply to those who have written upon the subject up to now.

In reply to Mr. J. Metcalfe, my engine did not usually gum up. It only "stuck" after the phenomenally long distances run without oiling, when, I take it, the oil was practically exhausted in the crank case, and the piston was almost upon the point of "seizing." As I stated, however, paraffin easily freed it, just as though it were gummed by excessive oiling, and I ran a distance of fifteen miles home with no ill effects. In the case of my engine, smoke did not issue when I injected one pumpful after the long runs mentioned. I would also add that my oil tap was a good fit, and was closed properly on the occasion mentioned, as on all others! Mr. Metcalfe's experience is certainly an interesting one, but is not identical with mine.

Replying to Mr. C. Fortescue Reade, my piston rings were new, and were only being "worked in." I still think that the unwonted stiffness in starting, after two successive distances of sixty-two and eighty-two miles with only one pumpful between, was caused by threatened seizure. A stiff piston, when trying to start, after only a few minutes' stop, the engine being still hot, is, I think, a fairly good indication of this. When the piston rings have become worn I will look out for the stiffness Mr. Reade mentions.

In reference to "H. G.'s" observations, my machine was not a new one, but was nearly a year old when I attempted the oil "starving" experiment. The engine had been cleaned fully a month before, when three pumps of oil were put into the crankcase (the usual amount after emptying), so it is most unlikely that there was a surplus of oil there, especially as the starting was usually easy, paraffin or petrol injections not being required. The astonishing thing to my mind is that after the exceptionally long distances run without oiling the engine continued, then and afterwards, to run well, although only one pumpful was injected after these distances, and not two or three pumpful. The cylinder was not removed for inspection, as the motor continued to work so well, a charge being given thereafter every thirty miles. It should be remembered, though, that the speed all this time was extremely moderate, principally owing to daily traffic riding, and during the long mileages above referred to I only touched legal limit occasionally. "H. G." asks

for particulars of my method of mileage computation. Well, every run, no matter if only of two or three miles, was carefully recorded in my pocket diary, and all the distances were taken from the "Cyclists' Touring Club Route Book," which I have found to be reliable. The only mistake which could have been made was that of omission, which would make the performance of the engine even more remarkable! Had there been any doubts about it I certainly would not have written to *The Motor Cycle* on this subject.

I might add that two months after the three charges above mentioned were put into the crank chamber, I emptied it out (the mileage being 950), and it stood a quarter of an inch high in a quart oil tin. I make it that there was a little under one pumpful in the crankcase, but, of course, a considerable quantity would adhere to the flywheels, cylinder, piston, etc. (Ten miles had been covered since the last half-pumpful was put in. I oil in half charges now, about every fifteen miles.) When a further distance of 250 miles was covered (three pumps having been again injected, after emptying the crankcase), the engine was taken down for removing carbon deposit, and I was told there was just the right amount of oil in it, and that the oil was not dirty. The deposit was just the average amount in 1,200 miles. This would go to show that for 15-20 m.p.h. a pumpful each thirty miles is enough.

The only reason I tried such distances as sixty to eighty miles without oiling was to see how far I could go at a moderate speed before the engine actually showed signs of requiring oil, as my previous machine always did so by falling off in speed if a pump were not given every eight miles at the outside! My experience was, as already related, that the only sign was stiffness of the piston (not through gumming), after a few minutes' stop. If this only occurs after sixty or eighty miles, the inference is that about every thirty miles is not too little. I should add that the engine never smokes, except when three full charges are put into the crankcase after cleaning out or emptying it.

Another thing which I wish to make clear is that the distances mentioned as having been covered without oiling are not necessarily continuous runs; they really are the aggregate of several runs, principally short. However, possibly the machine would have run nearly as far on a single journey if not driven above eighteen miles per hour, and if many hills were not encountered *en route*.

To conclude, the distance run between each pumpful (after the first three pumps referred to were injected) was as follows: 15 miles, 13, 12½, 22½, 15¼, 22, 19¼, 18½, 21, 19½, 22, 29, 30, 62, 82¼, 29½, 35¼, 36, 31¾, 34, 29¼, 31½, and there after about every 30 miles. The starting was stiff after the two longest distances, but easy on all other occasions. It will be noticed that the amount of lubricant given after the two occasions mentioned was even less than usual.

OILE.

SUMMARY OF CORRESPONDENCE.

J. E. Newing writes, that he has had a splendid run from Walthamstow to Land's End and back on a 4½ h.p. Bradbury tricar, with passenger and luggage, taking every hill on the road. Owing to the splendid quality of the R.O.M. tyre fitted to his machine he had no punctures whatever *en route*.

Price's Patent Candle Co., Ltd., write: "In the recently concluded A.C.U. Six Days' Trial all but three of the competitors who completed the trial were using one or other of our three grades of Motorine. It has come to our notice that two malicious and absolutely unfounded rumours with regard to this success are floating around. We are said, in the first place, to have been supplying oil superior to our regular brand, and, in the second place, that we were giving it all away. We may say, firstly, that the oil used by the competitors was in every respect absolutely identical with that offered for sale; secondly, that, with the exception of one half gallon given to a prominent trade rider, every drop was paid for to Mr. Luff Smith at usual rates."

LITETTE, 1908, water-cooled, grand order and condition	£45 0
CHATER-LEA triear, Garrard engine, excellent machine	£10 0
HUMBERETTE car, fine bargain	£30 0

Fullest particulars of any of above on application.

WE SUPPLY ALL MAKES OF MOTOR CYCLES. EXCHANGES. DEFERRED PAYMENTS.

TRIUMPHS FROM STOCK.

The PREMO

—the perfected two-stroke 3½ h.p. Motor Cycle—will soon be ready for the market. It will have the simplest and most reliable engine ever produced. It will be faster and a better climber than any other machine of less than twice its nominal power. On its first public appearance (August 15th) **IT WON** the Sutton Coldfield A.C. Hill Climb, beating the Twin Rex, Twin Norton, Triumphs, and others. It was **ALSO FIRST ON FORMULA**.

N.B.—We can book orders for the Premo Engine for delivery in rotation, beginning in 14 days.

ALL OUR GOODS ARE SENT ON APPROVAL.

Premier Motor Co., Ltd.,

ASTON ROAD, BIRMINGHAM.

Telephone 431c Telegrams, "Primus, Birmingham."

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle." When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be forwarded for replies. Only the number will appear on the advertisement. Replies should be addressed to the number, c/o "The Motor Cycle," Coventry"; or if "Letter" is added to the address, then to the number given in "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown parties may deal in perfect safety by availing themselves of the Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt upon intimation of the arrival and acceptance of goods, the money is forwarded less a charge of registration. The time allowed for a decision after the goods is three days. For all transactions exceeding in value, a deposit fee of 2s. 6d. is charged. Deposit matters are dealt with at Coventry, and all money orders should be made payable to Messrs. Sons Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive answers to their enquiries are requested to register their names as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to by post.

MOTOR BICYCLES FOR SALE.

SECTION I.

Northumberland, Cumberland, Durham, and Westmoreland.

2½ h.p. 1909 Twin N.S.U., magneto, perfect condition, very little used; £32.—Apply, Hodgson's, Northumberland St., Newcastle-on-Tyne.

3½ h.p. Minerva, late 1906, standard model, ad. out, show machine; cost with extras and sacrifice £14, or nearest offer.—130, Westce Rd. Shields.

TRIUMPH, 1908, absolutely perfect condition, out, show machine; cost with extras and sacrifice £52, genuine bargain, £35, or best offer.—Morley, Sq., Whitley Bay.

F.N., 1½ h.p., lightweight, 1908, very good condition, splendid hill-climber, magneto, spring fork, seat-pillar, handle-bar control, B. and B. car, Palmer back, spares; £18.—Wilson, Linden Cottages, Morpeth.

1¾ h.p. F.N. Lightweight, magneto, handle-bar control, new last year, in grand order, 17 g. 5 h.p. twin Rex, winner in competitions, £15; sold for Triumph, Humber, and N.S.U. motor cycles for booklets.—Turvey and Co., The Motor People, land.

1908 6-7h.p. Laurin and Klement (developed more), 2-cyl., magneto, thermo syphon, new, little used, well looked after, smartest, available 2-seater on the road, hood, spares; trial at guineas for immediate sale; motor cycle or tricar payment.—Stanton, 619, Lea Bridge Rd., Leyton.

INSURANCE.

PLEASE Send for full covering Motor Cycle from 18s. 6d. per annum.—Bass, Insurance, Ongar.

INSURANCE for Motor Cycles of every description arranged by Hugh J. Boswell, Insurance, Norwich; fire. 2s. 6d.; third party, 7s. 6d.; a 15s.; please write for particulars.

FINANCIAL.

R.O.M. Tyre Shares.—50 £1 fully paid part preference shares for sale at 45s. each, in or would sell part. The increasing reputation company's tyres is phenomenal, and, considering small capital of the company, the shares are worth a much bigger price by the end of the year.—Letters to D., 14, Dysons Rd., Upper E. Middlesex.

BUSINESSES FOR SALE.

CYCLE, Motor, main road, good workshop, tools, stock; £45, a bargain.—Box 3,023, Cycle Offices, Coventry.

SITUATIONS WANTED.

YOUNG Gentleman desires position in sound business, willing to take interest in same. £100.—Verden, Y.M.C.A., Leicester.

A LADY highly recommends a very superior man as under chauffeur, well trained; 10/- Apply, H.B., 27, Heath St., Hampstead.

SITUATION Wanted as assistant manager of established garage works, fully qualified engineer, sales experience, expert driver, steady, hard working holding similar position, highest testimonials, sound references.—No. 3,024, The Motor Cycle Coventry.

MOTOR EXPERTS.

IF Your Motor does not pull as it should cannot do better than to let me overhaul pistons, re-boring, re-bushing, replacements, competitive prices in consistence with reliability. Stanton, 619, Lea Bridge Rd., Leyton.

ENGINES.

4 1/2 h.p. De Dion Water-cooled Engine, spare parts, offers.—90, Banner St., E.C.

PHILON and Moore, must be first-class of approval, cash.—Full particulars to Attlee.

2 1/2 h.p. Givandan, as new, fast, splendid machine; £4.—61, Wanstead Park A Park.

2 1/2 h.p. Rex Engine, less piston and tap; 2 1/2 tandem fitment, 10s., new.—A. Spencer, Wilts.

30 S.—2h.p. Quadrant Engine, spare valves, controlled ignition, perfect.—57, North Brentwood.

3 h.p. Air-cooled Engine, standard maker, date; approval.—Particulars, Burrell, Rochford, Essex.

ENGINES for Cars, cycles, boats, and aeroplanes. Send for particulars to Advance Motor Ltd., Northampton.

MADISON, Littleover, Derby.—Genuine Motor manufacturing 3 1/2 h.p. air-cooled engine, with mare and lever control; price £4 19s. 6d., b.

4 h.p. Buchet Engine, overhead valves, crank silencer, B24 Longueunere carburetter, s forecar, very powerful; £6.—24, Woodford E Gate, London, E.

NEARLY New 3h.p. Engine, done about complete with exhaust box, etc., sacrifice or exchange for good forecar attachment, carburettor, tyres, etc.; approval willingly; reason bought 4h.p. engine.—Shirley, Coventry Rd.

IGNITION APPLIANCE

TREMBLERS for all makes of engines, pure platinum tips, 1s. 3d. each.—G.O.M., Birmingham.

IT is a fact.—Pure platinum is best for contact.—Meredith, G.O.M., Summer Lane, Birmingham.

DREADNOT Contact cure misfires. 2s. 6d. each.—Fellows, 49, Hertford St.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

The Tourist Trophy Race.

THE date of the Tourist Trophy Race is drawing near, and in a little more than three weeks from now we shall be in a position to declare the name of the winner and the make and type of machine he rode. From all we can hear, number of entries will be large, but *The Motor Cycle* being published on the same day as the date fixed for the closing of the entry list, we can only give the names of those received up to and including Monday 28th. These will be found elsewhere in this issue. There is one item in connection with the race which may have escaped the notice of some of the readers, and that is the dimensions of bore and stroke of some of the engines on machines which have been entered are so dangerously near the limits of cubical capacity laid down for the race that some of them may be unknowingly overstep the mark. That is to say, assuming the bore and stroke of any engine entered is laid on paper by the dimensions to work out at 499 cubic centimetres, it is possible for the wear which takes place between the time it is assembled and the completion of the race to account for the odd cubic centimetre. An engine which may not honestly exceed this size when it is newly machined may with several hundred miles of practice spins, and the mileage of the machine itself, be found to be in excess of the limit. We put this out so that those who may have ordered machines to very close limits may not be deceived into the belief that an engine which complies with the rules when new will remain the regulation size for several hundred miles.

The donations to the Tourist Trophy Fund are coming in very slowly, and we would take this opportunity of reminding our readers that every 20s. they

contribute will mean a still further increase of 1s. to the Fund, as *The Motor Cycle* has promised 1s. for every £1 contributed up to £100. Donations already received are acknowledged elsewhere in this issue.

"The Autocar League."

AS was briefly mentioned last week, a league of motorists has been formed by our contemporary, *The Autocar*, for the purpose of banding together the whole of the motorists of the kingdom. Motor cyclists will, of course, be welcomed to the ranks of the league, as it is only by means of presenting an undivided front that a league such as the one outlined can bring to bear the necessary weight and influence to secure reform in any direction where the interests of motorists are attacked.

One motor cyclist who has enrolled wrote to *The Autocar* last week as follows: "At present things are so hot in this quarter (Sussex) that, being a man of very moderate means, I am afraid to drive, and my machine is now laid by till a more convenient season." This rider is afraid that motor cyclists are to be left out in the cold. However, he and others need have no fear. *The Motor Cycle* is about to issue an enrolment form on similar lines to the one already sent out by *The Autocar*.

Although we do not recommend the extreme policy pursued by the correspondent referred to, we think that motor cyclists can in many instances influence the actions of county authorities who are in the habit of ordering pernicious police traps to be set on deserted stretches of road for the purpose of collecting sums of money in so-called fines. They can also by uniting under one banner help themselves in a way that would be quite impossible by any other method.

THE End-to-end Record.

By IVAN B. HART-DAVIES.

THOSE who have only read accounts of record rides over the classical End-to-end route can have little idea of the enormous amount of preparatory work an attempt on present day figures involves. It was not until I seriously set to work to arrange for my attempt on record that I realised what heavy correspondence meant. First and foremost I had to consider the machine on which success or failure rested, and for a long time I hesitated whether I would ride my Triumph on which I had done over 5,000 miles or order a new one. Finally the lot fell on a new machine with a specially large tank,

and I never regretted the choice, for not even a nut shook loose, and the engine was not touched from start to finish. At the very outset I found myself faced with a serious difficulty, for I had been presuming that the Triumph Company would assist me in every way, but they straightway refused to help me at all, and I was left with the pleasing alternative of letting the matter drop or arranging the long ride myself. This was perhaps a blessing in disguise, since I had at any rate a free hand, and was able to arrange exactly what I wanted. I had prepared my time schedule for thirty-eight hours, with ten minutes stops every 130 miles, and relied on having a good square meal at Wigan, the intermediate food consisting chiefly of porridge, bacon and eggs, a boiled

fowl, and milk pudding, etc., whilst at each checking place a packet of sandwiches was handed to me, made up of bread and butter and potted meat, to munch on the way. Each checker was also supplied with telegraph forms to wire time of departure to the next control, and since every man concerned had a printed schedule of distance and time, he could soon work out my average, and know when to expect me. During the night the telephone took the place of the telegraph, Exeter being in constant communication with Gloucester and Wigan. Over the rest of the details I will draw a veil—my test runs before breakfast, the angry clients who rang me up on the telephone to know whether I had retired from business, and my

constant anxiety concerning the weather, for I was backing my luck in starting from North to South.

A Change in the Weather Conditions.

However, luck was with me, for I left Rugby on the Friday evening on the night express in torrents of rain from the south-west, only to arrive at Wick on Saturday to find a keen-edged nor'-easter blowing with bone-dry roads. Such luck cannot last, I thought, and went in to peruse the visitors' book at Groat's, to read the details of the famous rides of the past, such as G. P. Mills's motor and cycle records, and those created by G. A. Olley, Tom Peck, Arthur W. Bentley, and others who have made the long journey.

I consider that such a book should not be left about, for it is the reverse of encouraging to the green aspirant for record honours. However, I scribbled my name, shut the book with a bang, and went off to bed at the early hour of six. Strange to say I fell asleep immediately, and was engaged in a frantic struggle to coax a 1 h.p. Mouse over the last forty miles to Land's End at an average of thirty-five when "Half past one, sir," brought me back to life. I was soon into my motor kit and enjoying a meal with three keen riders, one of them Mr. Robertson, of Wick, who not only was to time me out, but intended to ride south with me. There was just time

for a pipe, and before I could realise it the record ride had commenced.

From the first no time was lost, and in half an hour from the start Wick was reached. Thereafter my attention was fully occupied with corner work, especially in descending Berriedale. Hereabouts I parted company with Mr. Robertson, he having rendered me yeoman assistance during the first hour's ride. Down the Ord I flew, trickled through Golspie, following the confetti which had been laid for me on the doubtful corners, and picked up Mr. Herlihy close to Bone Bridge, only to lose him a few miles further on having an argument with a nail which I had missed by inches. Near Dingwall the float stuck up, and I was stranded

The writer immediately after his arrival at Land's End Hotel in record time. Few record breakers have finished such a long ride as fresh as Hart-Davies did.

The End-to-end Record.—

At 6.30 a.m. in a remote part of Scotland without petrol, so I had perforce to wait for Mr. Herlihy, get some from him, raid a garage in Dingwall which was luckily open, and before many minutes had passed was sitting down to an excellent breakfast at the Lovat Arms, Beaulieu, whilst Mr. Morrison attended to the machine. In twelve minutes we were off on the run to Perth, Mr. Adamson being my companion this time on a fast T.T. Triumph. Near Viemore my back tyre sat down so suddenly that I nearly followed its example, a big one or a piece of iron going right through the cover and both sides of the tube. Naturally, we made a poor job of it, being in a hurry, and had in consequence to pump up every twenty-five miles.

The Road over the Grampians.

The Grampians were in a disgraceful state, nothing but loose stones forming the road, and I varied proceedings between dodging boulders and riding on the grass at the side—a risky proceeding, since the boulders were often partly hidden and only discernible at the last moment. Perth hove in sight, and I could almost smell my lunch, whilst poor Adamson, I am sure, must have been thinking of it for many miles, for he started without breakfast, owing to my early arrival at Beaulieu. Here the tyre was promptly changed by Mr. McFarlane, machine and man “stoked,” and we were on running through Stirling. Lanark was passed (3.36 miles) at three o'clock, and here I again filled up with petrol. Half past four saw me at Lockerbie doing my best to eat three eggs and slabs of bread and jam in ten minutes.

Outside Lockerbie the back Dunlop picked up two flat nails at the same time, and some minutes were

wasted in trying to make the tube hold air, but a look round soon discovered the second nail, and thereafter all was peace from the puncture fiend until Land's End.

Scotland was soon left behind, and now the record began to appear a safe thing, barring accidents. The excellent machine made light of my weight, and so far the weather had been magnificent. Shap proved

The End-to-end record holder leaving the Lovat Arms, Beaulieu, after breakfasting.

light work, and with an “easy” through Lancaster and Preston we ran into Wigan at 9.30, just in time to avoid lighting up. After supper a council of war was held, for I now had to tackle the worst section of all in the dark—twisty roads, narrow lanes, and at least twenty points at which we could lose our way.

The Most Difficult Section of the Route.

Luckily, in view of Mr. Bentley's harrowing experiences, I had arranged for confetti to be laid by a friend named Rupert May, and, bidding J. H. Brereton good-night, we were soon “hopping” it six strong through the night. Nearing Tarpörey I took a wrong turning, and pulled up suddenly, receiving the full weight of one of my followers who was unable to stop in time in the middle of my back, luckily without any further damage than a crumpled number plate. This contretemps laid my assailant's machine out and reduced our numbers, for which I was secretly thankful. But a greater surprise was in store for us. It appeared that the confetti could not be seen in the dark, and Rupert May, J. C. O'Rafferty, and H. Potts, on discovering this, hurried to Tarpörey to guide me through. I almost fell on their necks in my joy, for I had been dreading this section. Details were soon arranged; May was to lead and I to follow, whilst the rest had to hurry along in the dust and dark

One of the acute bends on Berriedale, which hill is descended if the rider travels southwards. Here was that Tom Peck, riding a Rex, came to grief last month, as already reported.

The End-to-end Record.—

as best they could. From what I gathered afterwards, the "back seats" were not in favour, and I know that I had my work cut out to get round the various corners, steering by May's back. It was a marvel to all of us how he managed to see so well, and

never made a false turn. Had he done so and suddenly stopped we should all have piled ourselves up on top of him, for I was steering by his white coat, and he was riding by my light, which threw a splendid beam some distance ahead. In the early hours when no one was about two of the party failed to get round a corner, and fell with a clashing and grinding of metal. O'Rafferty punctured in Kidderminster, and did a marvellously quick repair, reaching Gloucester only five minutes after me. Poor Gibson came a heavy cropper on a

with every hope of success. Once more the miles slipped by; Clifton Suspension Bridge loomed up and disappeared, Red Hill was pushed behind, and before long we began to pick up the Exeter contingent of followers, several of whom, warned by the telephone, came out to meet us, whilst Mr. Williams, of Exeter, kindly sent out a car to guard an awkward turn, and also stationed a man with a white flag to guide us to Deller's Café. I certainly did not need much guiding, since my appetite had been troubling me for some miles, chiefly owing to the fact that I spent my time in Gloucester laughing at the dirty faces of my followers, especially O'Rafferty's. I can only conclude that they were too polite to return the compliment, since I had not shaved since the previous Saturday, and one glance at a mirror was sufficient to drive me to the wash basin. More porridge, which I shared with Gibson, ham and eggs ditto, and we were heading for the twisty Cornish lanes and Land's End.

Nearing the End.

There is a nasty little hill out of Exeter once you have slithered down the heavily watered tramlines, but "Miss Triumph" took her load to the top, as if she had only run 5 miles instead of close on 800. Once again thirty-four miles were devoured in the first hour, but the claims of live stock, frisky horses, and corners innumerable demanded caution with the goal almost in sight. A short stop in Bodmin for petrol was made, narrow Camborne safely negotiated, and the throttle was closed a trifle, since the record was safe, and I was well in front of time. Penzance was passed at 12 o'clock, and I could picture to myself the timekeepers listening for the sound of my engine, since there was a thick sea mist, and it was difficult to see more than 100 yards. How long those ten miles seemed! But at length I turned the corner, and

To show there are two prominent motor cyclists of the name of Davies. Ivan B. Hart-Davies, the End-to-end record holder, is on the left, while the other is Basil H. Davies, a regular contributor to the columns of this journal.

nasty corner near Kidderminster, which I just succeeded in scratching round by the skin of my teeth, and for a few minutes I thought he was seriously hurt. However, he pluckily remounted, and continued right through to Land's End. All through Bridgnorth and Kidderminster we were anxiously watching for the dawn, which seemed as if it were never coming; but the darkness of the night was to some extent relieved by the furnace flames of the Black Country, proving at any rate that we were on the right road. Perhaps the night seemed longer than usual owing to the strain of fast driving mile after mile in close company, and it was with feelings of relief that we saw the Malvern Hills slipping past on the right, with Tewkesbury close at hand. Now the light rapidly strengthened as if to make up for its former tardiness, and in a few minutes we were slowing up at the Bell Hotel in Gloucester with C. F. A. Cooper on guard.

Porridge, bacon, and eggs, cooked to a turn by my brother Aubrey, soon vanished, and, reinforced by F. C. Mustard, fresh from the Six Days' Trials, the last two stages were entered on

Land's End at last. I. B. Hart-Davies seated in the centre of a group of motor cyclists who acted as followers and assisted him to annex the record.

End-to-end Record.—

ould dimly see the dark shadow of the hotel, with shadowy figures running excitedly to and fro. "12.22, did you have beaten the record by 7h. 16m.," was the announcement, and my ride was over "thirty-three years of glorious life" was my mental comment, and one that you will never experience again" was added as an afterthought.

The attentions of the photographer had first to be satisfied, and then lunch claimed us, whilst the cavalcade of followers poured in—Hobgen on the 6 h.p. Bat, rider of a 2 h.p. Motô-Rêve, Hugh Gibson (who had puncture and then lost his way, going right through the south of Cornwall), F. C. Mustard (who had stopped to wash the dust out of his throat, presumably with water), and others who had joined in the hunt at various points.

Reflections on the Ride.

Of the trusty Triumph I cannot speak too highly. The figures prove its worth, for a machine that can carry a fourteen-stone rider over every variety of road from John-o'-Groat's to Land's End at the speed required to break a record deserves unbounded praise. I feel that the honour must be divided between the machine, the weather, and my followers and helpers. The weather must have been specially lent for the occasion, whilst every man was in his appointed place and did his share ungrudgingly. It was a complete surprise to me to find such keenness and enthusiasm from one end of the kingdom to the other, and to all who assisted I tender my heartiest thanks. The record has been beaten, and will be

beaten again, and I can only hope that the next man will be equally favoured by luck. To this combination of circumstances I owe it that I finished so fresh. In fact, beyond a slight swelling of the hands, due no doubt to vibration, I felt as fit as when I started; there is therefore little doubt that the modern machine is not the nerve-racking vehicle its detractors assert it to be. Moreover, J. Robertson told me before starting that Tom Peck was quite fresh at the finish when he timed him in at Groat's in May. I thought the Scottish scenery magnificent, especially down to Brora, whilst the approach to the Grampians is grand. Naturally, one missed much of the beauty, owing to the vileness of the "road" and the necessity for keeping a careful eye on the corners and sheep, but a ride over the Scottish portion at a gentler speed is a pleasure I hope to experience at a later date. It was my first experience of Scottish scenery, for I had never been north of Perth before, and perhaps a Scotch mist would cause me to alter my views.

It is pleasing to be able to record no mishaps or inconvenience to the general public, for the roads were singularly deserted and free from traffic. This, perhaps, can be partly accounted for by the fact that I started at 3 a.m., and therefore only had one afternoon, which was chiefly spent on the broad high road over Beattock summit and Shap. Such a speed as I averaged does not necessarily mean reckless driving, and all motorists will doubtless be able to appreciate the distinction. Late in the afternoon we returned to Penzance for tea and dinner, and caught the 10.30 next morning for home and arrears of business.

OCCASIONAL COMMENTS.

By "IXION."

The Tourist Trophy Race.

Never have we been able to look forward to such a T. Race as we are promised this year, and I hope one of the big clubs will organise a trip to the island inclusive prices, so as to attract a good muster of spectators. I should like to see Marshall and Collier fight out the rubber, but the inclusion of the twins has made the event extremely open, and I doubt if either Marshall or Collier are feeling remarkably sanguine about finishing first, though probably each of them is convinced he is just a bit too hot for the other. Who said Lee Evans? I happen to know the Indians which have been winning at Brooklands are the same machines which have been used all the year on the roads. Wells is just doing a little missionary work at the present, until he can get regular deliveries from the big Hendee factory. A machine that can do better than sixty miles per hour on Brooklands and go to gain a gold medal in the Six Days is a formidable competitor in a road race. Then there are several very dark horses in the twin-cylinder class, and altogether I am more than doubtful whether the experiment of lumping twins and single-cylinders together will be repeated. If I may presume to offer a word of advice to one or two amateur entrants I have heard of, it is this: You have not just got to get the fastest bat obtainable out of your engine, but you have to keep it up for a good many hours on end. I fancy several who will dazzle us the first time round

will be travelling badly on the second circuit, and out of it altogether on the third. The fuel limit forbade such a generous carburetter adjustment as is now permissible, but the need of combining stamina with pace will have a very similar effect, and many carburetters will be adjusted in the Isle of Man almost as stingily as if there were a fuel limit still in existence.

Carburetter Air By-passes.

A good many riders are accustomed to run down steep hills with the throttle shut, using engine compression as an auxiliary brake, though more with the idea of cooling the engine than of utilising additional braking facilities. It is astounding that the modern motor cycle is minus an air by-pass, *i.e.*, a means by which pure air is fed into the cylinders when the throttle is shut. If the rider has a switch he can switch off and leave the throttle open, so cooling the engine but wasting fuel. This is better than sparking with the throttle shut, but is not maximum efficiency, because fuel is being wasted. The idea is that when the throttle is shut a fresh air by-pass should be opened, which has three advantages:

- (a) The engine is cooled.
- (b) No fuel is being vaporised.
- (c) The switch, with those possibilities of trouble which it always connotes, can be dispensed with.
- (d) The engine acts as a brake.

Yet I doubt if three standard makes are provided with this simple and desirable fitment.

QUESTIONS AND REPLIES

The Reason for Coiling Petrol Pipes.

Q. A friend and myself have different opinions as to the use of the coils in a petrol feed pipe. My friend says that the coils are to lessen the flow of petrol to the carburetter and stop flooding. I maintain that they are to serve as a spring to prevent breakage of the pipe. We have decided to take your decision as final.—W. F., Sussex.

Your explanation is perfectly correct. The coils in the pipes are to prevent breakage, and, in the event of breakage close to the union, to allow a fresh joint to be made without unduly shortening the pipe.

Inland Revenue Tax Exemptions.

Q. Please inform me whether I am exempt or not from the Inland Revenue licence for a motor cycle? I am in the insurance business, and have a long and straggling country district to work, and I use my motor cycle for this work. I judge from the case at Spalding I am exempt, but would like to know for certain.—E.L.H., Holywell.

Unless you can satisfactorily prove to the Inland Revenue authorities that you use your motor bicycle solely and entirely for business purposes, and never, on any occasion, for your own pleasure, you cannot be exempted from the tax.

Shipping and Freight to Melbourne.

Q. What is the cost of sending a motor bicycle to Australia, also cost of duty? Should the motor cycle be entirely closed in a wooden box? In Melbourne the price of a first-class machine is £70 to £75. Do you advise me to send one out there, or instruct my friend to purchase when landing?—M. GROVES, Bolton.

The cost of shipping a motor bicycle to Melbourne is 47s. The duty is 25% *ad valorem* for a British-made machine, and 30% *ad valorem* for a machine of foreign manufacture. Full particulars regarding shipment to Australia can be obtained from Davies, Turner, and Co., Ltd., 52, Lime Street, E.C. They would probably undertake to pack the machine for you. It should, of course, be packed securely in a wooden case. We advise purchase in Melbourne. Nothing can be saved by shipping a new machine to Australia after freight, duty, etc., are paid.

Chronic Misfiring.

Q. I have an old pattern 3½ h.p. Rex motor bicycle, and it has misfired from the time it was newly purchased. I have tried everything I can think of to remedy it, but have failed up to now. I have fitted a new trembler coil, also a new wipe contact breaker to the engine, tried various-sized spraying jets in the Longuemare carburetter, but it still misfires. Have tried different sparking plugs, the timing is correct, petrol tube is clear from tank to the carburetter, and valves appear to work freely. Engine has plenty of power for hill-climbing, but I cannot get more than about eighteen miles an hour on the level, gear 5½ to 1. Engine misses at all speeds whether the spark is advanced or retarded. If you can suggest a remedy I shall be much obliged.—H. SKINNER, Dover.

We should recommend you to carefully adjust trembler on coil, see that accumulators are fully charged, then look to both inlet and exhaust valve springs. If the springs are by any chance too weak the engine will misfire exactly as if the ignition were wrong. If you can by any means get a magneto fitted to the engine you

will find it will make it far more reliable. The machine is quite capable of travelling at a good speed.

Clutch Leathers on Tricars.

Q. The clutch of my 6½ h.p. tricar gives me a lot of trouble. The leathers burn out quickly, sometimes in 100 miles. I have tried all sorts of leathers, and all dressings as advised in "Hints and Tips," and by "Ixion" in 1907. The fact is the clutch is too small (6in. by 1in.), but there is not sufficient room to enlarge it. Can I with safety try brake lining, such as canvas, fibre or copper? I can put the clutch in and out very gently, as it is operated by hand, and there is no spring. Can you suggest a cure, other than enlarging clutch? I can remove old leathers and fit a new one in an hour, but of course it is a dirty job.—B.W.J. Stafford.

You might try a canvas or composition brake lining on the clutch, such as Frood's patent, which can be obtained from almost any of the well-known accessory dealers. We have never heard of it being tried in connection with tricar clutch, but it would be an experiment worth attempting. Have you tried using the very best quality sole leathers and dressing it with "Collan" oil at fairly frequent intervals?

The tea interval was a popular feature at the Coventry and Warwickshire M.C.'s Motor Cycle Hill-climbing Competition at Newnham, near Daventry. Officials, competitors, and spectators are here seen enjoying their tea and the splendid view obtainable from the field at the summit.

O. C. Godfrey (3½ h.p. Rex Speed King) at the summit of Newnham Hill, Daventry. Godfrey obtained sixth position on time, a companion machine ridden by J. C. Smyth making the fastest single-cylinder time of the day.

Misfiring in One Cylinder at Slow Speed.

I have a twin-cylinder Vindec, 1907 model, and cannot get both cylinders to fire at low speeds. If I slow down to about twelve or fourteen miles an hour, the rear cylinder immediately stops firing. Both inlet valve springs are of an equal tension. I should be much indebted to you if you could advise me what to do.—R. O. HASTINGS.

The trouble is probably due to the failure of the carburetter to supply a rich enough mixture at low speeds to ensure regular firing. Fitting such a device as the White's Economiser may possibly cure the trouble, or, if you can reduce the space round the jet of the carburetter in any way and enlarge the additional air openings to compensate, you will probably be able to run quite slowly with extra air closed.

Touring in Devonshire.

I am contemplating visiting Lynmouth shortly on my 7-9 h.p. Bat-J.A.P. and sidecar; total weight of passengers 21 stones. I have only a single gear with adjustable pulley, and I am a little doubtful whether I should be able to get up Porlock Hill and also the hill out of Lynmouth towards Minehead. Do you think I could get up these hills, and if so what gear do you think I should use? I know the road from Minehead to Lynmouth well, having travelled on it several times by coach, and from what I remember of Porlock Hill it would be almost dangerous to attempt it with an empty sidecar on account of the bend half-way up it. Am I correct?—ENGINEER, Lancs.

We should advise you to gear quite as low as 6 to 1 for these excessively steep hills, and it is even then doubtful with a gear as high as this you would climb them with a passenger. It would certainly be difficult to negotiate the corner on Porlock with no weight in the sidecar, but with a low gear and are you should be able to manage it in safety. Your machine is a powerful one, and a trial of these ascents would certainly be interesting. Why not have two-speed gear fitted?

One or Two Silencers.

Do you think I can render my 3½ h.p. motor cycle more silent if I were to fit a second silencer beyond the present one? The present silencer is in front of the crankcase. I propose to leave it just where it is, and carry a pipe from the outlet to the back of the crankcase, and there fit a second silencer. Would this cause back pressure, the exhaust having to pass through two silencers? There is 4in. clearance between bottom of crankcase and the ground. Would that allow for a 1in. pipe to be carried underneath the crankcase, and would the pipe be likely to catch obstructions on the road?—W.B.G.

We should recommend you to remove the present silencer and fit another one. There would be no object in having two unless you remove all the baffle plates from the present silencer and use it simply as an expansion chamber. There is sufficient clearance underneath the crankcase if machine is ridden only on good roads.

Advice re Purchase of a Second-hand Machine.

I know nothing whatever about motor cycles, but I thought of buying a second-hand one so that I could ride to my work and return home daily—about thirty miles the double journey. A few stiffish hills in it. I intend riding the machine all the year round. (1.) Can you give me any advice as to the most suitable type and power to buy? Could I get one for £10 that would not always be breaking down? (2.) Can you give me some idea of the cost of petrol, say for 200 miles per week? (3.) How much should it cost for the upkeep per week, repairs included? I expect you cannot answer the third question definitely, but perhaps you can give me some idea of the average total cost.—T. MILLS, Cleckheaton.

(1.) What you had better get is a single-cylinder machine of about 2½ to 3 h.p. £10 is a low price for a good second-hand machine. It would be advisable to study the miscellaneous advertisement columns of *The Motor Cycle* and write to some of the best known dealers, and ask them to let you know what they have on their books at the price you are prepared to pay. (2.) An average motor cycle of 2½ to 3 h.p. will cover about eighty miles to the gallon of petrol. The present price of petrol is 1s. 3d. to 1s. 4d. per gallon. (3.) You should have no difficulty in running a machine 200 miles a week for 5s. to 7s. 6d. per week. It is impossible to estimate repairs, but these should be few and far between if machine is a good one to start with and in good order. If you care to send us a numbered list of the machines which you think might suit you, keeping a copy by you for reference, we will place them in order of merit, but second-hand machines should always be examined by an expert before purchase, failing that adopt the deposit system.

READERS' REPLIES.

Clutch Slipping on Steep Hills.

I notice in reply to a query in *The Motor Cycle* regarding Mabon clutch slipping that over-oiling is mentioned as the likely cause. I am inclined to think the Bowden wire is adjusted too tightly at the stop. This would put the pressure of the clutch spring on the fork and wire instead of the clutch plates, and would have the same effect as keeping it partly disengaged. I enclose an illustration showing the incorrect method of adjustment by dotted lines. You will see from this that it is possible to entirely free the engine by tightening the wire too much at the stop.—A. MABON.

close an illustration showing the incorrect method of adjustment by dotted lines. You will see from this that it is possible to entirely free the engine by tightening the wire too much at the stop.—A. MABON.

Loss of Power on Hills.

In reply to "G.A." in the issue of August 18th who enquired re 3 h.p. Quadrant, I have one and substituted rigid for the spring forks supplied, also a spray carburetter for the surface type. I should advise "G.A." to do the same, also to rewire the machine, especially the contact breaker, replace worn contact breaker parts, fit new valve springs and check timing. Fit the release valve outside contact case, solder a copper pipe to the nut on hollow shaft and stop up present holes and so avoid dirty wires and contacts. Check inlet valve for wear on guide and stem. My Quadrant will take me anywhere.—G. F. C.

An unofficial weighing in at Daventry on August 21st. V. A. Holroyd, chief marshal of the Newnham Hill-climb, on the scales. Weight 239½ lbs. minus his four-cylinder F.N.

Gear Ratios and Flexibility.

By ENGINEER.

OF all the hill-climbing competitions that have been held from time to time it is very questionable whether any real good has been done in the development of motor cycles from the amateur owner's point of view. These competitions are usually held on hills which permit of a good flying start; therefore the steepest gradients can be rushed and taken at very fast speeds. The course is usually kept clear of other traffic, and there is nothing to obstruct the riders in their upward flights. The engines have generally been specially tuned up—in fact, in only a few cases are they engines which are fitted to touring machines. It is no uncommon sight to see a few rider spectators on standard machines attempt to climb a hill either before or after the contest, and if the hill is a steep one such machines more often than not fail to get up without pedal assistance, whereas the same makes of machines invariably romp up the hill in competition.

Generally speaking, an engine specially tuned up for hill-climbing competitions is unsuitable for everyday use. Such an engine is not flexible, and cannot be slowed down nicely to suit various conditions, such as traffic. High speeds and hill-climbing power have usually been gained at the expense of comfort and ease of control.

Change Speed Gears Wanted.

Most motor cycle engines are necessarily light and of comparatively small dimensions. The majority of motor bicycles have a fixed gear ratio, so that speed and hill-climbing depend upon the engine being powerful and flexible enough to do all that is required without an alteration to the gear ratio. Motor cars have two or more gear ratios which can be varied at the will of the driver, and in addition the engine is usually more flexible and powerful than a motor cycle engine, so that there is not much difficulty nowadays in tackling the worst hills in the country.

In the opinion of the writer a motor cycle should be so designed that it is the equal of a motor car in hill-climbing without recourse to excessive power. The obvious course is a change speed gear box or some method of altering the gear ratios whilst running. My requirements in a motor cycle for daily use under all conditions are to be able to take the very worst corners on hills safely at a speed which depends upon the state of the surface and the traffic, and yet be able to pick up speed after the corner is passed.

No motor cycle has yet been made which will do all these things without a variable gear of some sort.

In theory the so-called infinitely variable speed gear is ideal for hill-climbing and general touring purposes. In any contest between equally skilled riders where the horse-power of the engine, the weight of machine and rider, and the wind resistance are equal the infinitely variably geared motor cycle must win against the one with a fixed gear ratio. This is only commonsense for the following reason. Every professional tester or amateur tuner up of petrol engines knows that there is a certain crankshaft speed at which an engine develops its maximum power. In modern engines the power curve usually rises in a straight line, and keeps on rising until very high engine speeds are obtained—

E. Kieckham, 7-9 h.p. Leader-Peugeot, on the steepest part of Newnham. This rider accomplished the second fastest time of the day at the Coventry and Warwickshire M.C.'s Open Hill-climb.

in fact, much higher speeds than are desirable when sustained effort is required from the engine. An air-cooled engine will run for a very considerable period at a high speed and develop satisfactory power, but at a certain point is usually found above which it is not desirable to run, because the engine soon overheats. For practical purposes it may be assumed that the critical engine speed is the best to run at for any sustained effort. If such an engine is fitted into a bicycle which has an infinitely variable speed gear and a speed counter is connected to the engine-shaft the best results can be obtained from that bicycle by simply altering the gear ratio whilst running, and by

The Time for the Tour

is now—no other period of the year is so suitable or so full of pleasure possibilities.

Before you set out, however, there are many details which should claim your attention—not the least of these, the question of equipment.

You naturally desire efficiency in this direction—

BROOKS BAGS

will give you that.

Individually, they are invaluable as receptacles for every class of luggage—collectively they form an ideal motoring equipment.

We illustrate two, the others are of equal interest, and are all fully described in our latest Bag and Saddle Manual which we will send you free. Dept. B 45.

J. B. Brooks & Co., Ltd., Birmingham.

PANNIER BAG.

17/6 & 26/-

Supplied in pairs or singly.

Supposing

the Saddle is not a BROOKS, it cannot yield that perfect comfort which is essential to the success and enjoyment of your Tour, because it cannot embody those exclusive features which make perfect comfort possible. Take one only—the

BROOKS PATENT COMPOUND SPRINGS

as fitted to every model of the

BROOKS ANTI-VIBRATORY SADDLES & SEATS

These absorb vibration as none other can, and totally eradicate all tendency to bounce—

That means a saddle of perfect ease—a seat of perfect luxury, and—

Remember, that is only one of the merits which make for its superiority—

There are many others, and you should learn more of them by a study of our Saddle Manual, which we will send you free.—Dept. B45.

Ratios and Flexibility.—

When the speed counter the engine revolutions may be allowed to keep up to the above mentioned critical speed. No better result than this can be obtained.

If a hill is being climbed with a variably geared machine and the engine speed rises above the critical at the gear ratio can be raised until the maximum is obtained, and then if the engine still runs faster than critical speed it means that there is a reserve of power, and the engine would stand a higher maximum without fear of overheating. Overheating takes place when the rider tries to flog the machine along on a high gear, and therefore a lower engine speed is the critical one.

This critical speed is also usually the best for least petrol consumption. In hill-climbing competitions it is noticeable that the machines doing fastest usually occupy low positions in the formula table, though petrol consumption is not taken into account. They would also show excessive petrol consumption if the fuel were measured, and this goes to prove that engines are not highly efficient.

Those who study the subject carefully will, I think, see that a straightway rush up a hill is not a fair test of a machine's capabilities. It is no uncommon thing for competitors to protest against sharp bends on a hill; they say they are dangerous, and that they cannot negotiate the curves safely. Of course, they cannot with a single geared machine, and if they slow

down for the corner they possibly cannot pick up again. Hill-climbing competitions should be arranged on hills which are as twisty as possible, in order to make it impossible for ridiculously high powered machines to attain such a speed that they become a source of danger to the riders. On reaching a bend the engine should be flexible enough to enable the curve to be negotiated safely and to pick up again. If similar slowing and restarting tests were introduced in all climbs it would be obvious to the prospective purchaser that a machine that could be safely handled at corners would be most useful for touring purposes.

A hill-climbing competition has been announced by the A.C.U. to be held in the Isle of Man after the Tourist Trophy Motor Cycle Race on the 23rd inst., and I would suggest that the most tortuous hill in the island be selected for this event. We should then see a real test of flexibility. There is a good road leading out of Ramsey up which motor cars have been raced for the *Graphic* Trophy. Another is just beyond Glen Helen on the Kirk Michael side, and there is also the hardest test hill in the island, *i.e.*, the mountain climb from Ramsey to the Bungalow. I fear the latter would be too big a test for air cooled engines, although it would prove whether the cooling ribs are really sufficient for cooling an engine on a long mountain climb.

I hope some of the suggestions thrown out in this article may meet with the approval of those who are making the arrangements for the hill-climb.

Newnham Hill-climbing Competition. A scene in the yard of Reynolds's Garage, Daventry, on August 21st. Officials checking and weighing the competitors and their machines.

End-to-end Record.

Will J. C. Smith, of Schull, who beat A. J. Kettle in the Irish End-to-end Record on June 12th, kindly communicate with the Editor?

Reminiscence of the 1908 End-to-end Trial.

Gordon Gibson, who is touring in the North of Scotland, informs us that he saw one of the old 1908 A.C.U. cars still in use and in a very conspicuous position at Brora one day last week.

Motor Cyclist Banned at Fallowfield.

We understand that Harry Rignold, well-known a few years ago as a prominent racing motor cyclist, was used permission to ride at Fallowfield Sports by the Manchester Athletic Club on Saturday last. Rignold had been billed all over the city as one of the attractions of the meeting, and the news naturally caused a great stir. No action has been given.

German Motor Cycle Trials.

To-morrow (Thursday, September 2nd) a big trial for motor cycles and small cars will be held by the Lorraine branch of the German Motor Cyclists' Association. Machines must be in touring trim, and will be divided into five classes, comprising machines from 3 h.p. to 8 h.p. The start will be at Metz and the finish at Strasburg.

Kilometre Race Meeting.

Six motor cycles, five N.S.U.'s and one Puch, were entered for the one kilometre Race Meeting organised by the Frankfurt Motor Club. Eugen Kieners, on an N.S.U., won the race in 32.6s., which is equal to a speed of 68½ miles an hour. A. Noll, of Bisseldorff, on a Puch, was second in 4s. The meeting was well attended, the Grand Duke of Hesse and his consort being among the spectators.

Police Traps.

We are informed that from August 1st till September 26th all motor cars and motor cycles will be timed from the Green Man, Sparham, to Bawdswell, and the Bell Hotel, Bawdswell, to the Green and Hounds, Foxley. Both these positions are on the main road from Norwich to Fakenham.

In the vicinity of Maidstone, on the Ashford and London roads.

On the road between Banff and McDuff. All the traps in Banffshire appear to be about four miles in length, and the twenty miles limit is strictly enforced.

A measured 220 yards in Whitehall, W., usually worked on Sundays.

In the Albert Bridge Road andattersea Bridge Road, worked alternately by three policemen.

Within five or six miles of Helston, on the Truro-Falmouth-Helston road, and anywhere between Helston and Lizard. These roads are intermittently trapped.

Between Pitlochry and Dunkeld, through Auchterarder, and a timed mile speed limit near Dunkeld.

One mile north of Petersfield, on the London-Portsmouth road, beginning at a spot known as Adhurst Hill, etc. Over twenty motorists were timed at Petersfield last week.

The Return of Borrowed Parts.

Will the motor cyclist who borrowed a Darop sparking plug and a spanner from a gentleman on the London-Folkestone road on August 7th kindly return the articles to C. Smith, 19, Cheriton Square, Balham, S.W.? We are pleased to say the owner of the borrowed accumulator referred to last week has recovered his property through the instrumentality of *The Motor Cycle*.

Are Special Motor Roads Wanted?

A memorandum explanatory of the Development and Roads Improvement Funds Bill was issued on Thursday evening last. The Road Board is the section which is of the greatest interest to motorists. This board is to be given power to construct new roads which it is intended will be primarily confined to motor traffic, and the speed limit will not apply on such roads. The question is, are special motor roads required or desired by motorists, and particularly by motor cyclists? We think not, because the present roads are, generally speaking, suitable. If the suggested motor roads are ever

FUTURE EVENTS.

Sept. 1.—Entries close for the Tourist Trophy Race on Sept. 23rd.

Sept. 4—M.C.C. Members' Petrol Consumption Trial Start 4 p.m.

Sept. 5—Mont Ventoux (France) Hill-climb.

Sept. 12—Semmering Hill-climb (Austria).

Sept. 23—THE TOURIST TROPHY RACE FOR MOTOR CYCLES IN THE ISLE OF MAN.

Oct. 6—Race meeting at Brooklands.

Oct. 9—Proposed Two Hours' Record Race at Brooklands, organised by the British M.C.R.C.

Oct. 16—A.C.U. Fourth Quarterly Trial of 1909, Uxbridge to Banbury and back.

constructed, it is probable that the present speed limit on ordinary roads will be reduced. In other words, motorists may be told that speeds in excess of some ridiculous limit, which may be fixed, are only permissible on the special roads which have been constructed for their use. On ordinary roads they will be expected to travel at the speed of a market gardener's cart. A bill to spend the money collected from motor and petrol taxes on improving the present roads would be far more sensible, and would, we feel sure, meet the wishes of the bulk of motorists. We do not want special motor roads! We want the present ones made suitable for modern traffic conditions.

Bluejackets' Sports on Whale Island.

A motor bicycle potato race was included in the H.M.S. Excellent sports on Whale Island last Saturday. There were over 8,000 visitors. In the potato race the officers had to start and ride to top of track, take a potato from a table, and return and put potato in a bucket. Lieut. Hart won, riding a 3½ h.p. Triumph. Other competitors rode Brown, Triumph, Vindec, and White and Poppe engined motor cycles.

Hill Climb in the Isle of Man.

The A.C.U. has decided to hold the hill-climb which is to follow the Tourist Trophy Race in the Isle of Man at Kiwague Hill, on Friday, September 24th. There will be four classes, as follows: Class I., for genuine standard touring machines not exceeding 750 cc. Class II., for single-cylinder T.T. models as used in the race. Class III., for multi-cylinder T.T. models as used in the race. Class IV., for privately owned machines with engines not exceeding 750 cc.

Motor Cycle Stolen.

With regard to the theft from F. Horner and Co.'s premises on August 8th, mentioned in the issue of the 18th ult., through an error in punctuation, we were led to believe that a frame only was removed. We now learn that the loss was more serious. A new 3½ h.p. Rex motor bicycle, numbered on frame 20398, was stolen on the night in question.

Brooklands October Meeting.

In view of the success which attended the meeting held on Wednesday, 30th June last, and as a result of numerous representations made to Major Lindsay Lloyd on the subject, especially by B.A.R.C. members, it has been decided to alter the date of the October meeting to Wednesday, October 6th. Two motor cycle events will be run—(a) the autumn handicap, cylinder capacity limit 500 c.c.; (b) the October handicap, cylinder capacity over 450 and under 1,000 cubic centimetres.

German Motor Cycle Corps.

The Imperial Treasury and the military officials have fixed the following rate as pension for disabled volunteer motor cyclists. The average yearly earnings of a motor cyclist will be assumed to be £182. The army pension allowed for total disablement on this income is £95 yearly during life, with a contingent extra war pension of £15. A motor cyclist's pension might therefore amount to £110 per annum. Married men will not be enrolled in the Corps, because in the event of a motor cyclist being killed his family would not be entitled to receive more compensation than the family of an ordinary soldier.

Speed Limit applied for in Saxmundham (Suffolk).

At a meeting of the Saxmundham Urban District Council, held on Aug. 19th, it was unanimously agreed to petition the county council to reduce the speed of motor vehicles in Saxmundham to ten miles an hour. One member of the council said that he thought motor cars and motor cycles were driven through the town at a reckless pace, whilst another confined his remarks to motor cycles. *The Chairman reminded the council that in some districts where police traps were set traders were petitioning to have them removed because trade was leaving the towns near where they were set.* The Clerk to the Rural District Council said that a car which passed his office nearly shook him out of his chair. Perhaps the urban council's offices and furniture are not of the most substantial construction, or maybe the motor car referred to was a steam tractor.

Essex M.C. Twenty-four Hours' Ride.

SPLENDID weather favoured the club for its annual ride from Woodford to York and back, which took place on Friday and Saturday last. The following took part: A. E. Parsons (5 Acacia Special), G. L. Andrews (2 Moto-Rêve), C. J. Janssen (2 Moto-Rêve), F. A. Hardy (3½ Norton), F. E. Hardy (5 V.S.), A. V. Deacock (2 Moto-Rêve), W. Pratt (3½ Phelon and Moore), W. Cooper (3½ Triumph), W. H. Wells (5 Indian), G. Lee Evans (5 Indian), F. C. Wood (4 N.S.U.), G. L. Fletcher (2½ Douglas), B. C. Siffken (5 Rex), F. G. Smith (3½ Triumph), A. G. Peppercorn (3½ Triumph), W. H. Applebee (3½ Rex), F. W. Applebee (5 Rex and sidecar), B. A. Hill (2½ Douglas), W. Pershke (8 Colibri car), and M. Krause (7 V.S. car).

The riders were accompanied by two official cars. The first, a 14 h.p. Austin, kindly lent by L. B. Feeney, started fifteen minutes ahead of the first man, with Timekeeper Ebbelwhite aboard. The other car was a 15 h.p. Rover, placed at the disposal of the club by F. J. Jenkins, who was accompanied on the run by R. H. Head. The Rover car started last, and took the hon. secretary through.

The route was from Woodford *via* Bishop's Stortford, Cambridge, Huntingdon, Stamford, Grantham, Retford, Doncaster, and Ferrybridge, to York. Arrangements had been made for food at Grantham on both journeys and at the Windmill Hotel, York. The course was well marked by arrows and coloured lanterns, red meaning a left turn and green a right. The lanterns made it very easy to follow the road during the night. We occupied a seat on the Rover car, and very soon began to pick up the men. Among the earliest in trouble was W. Pratt, trying to light his lamp, and this seemed to be the cause of delay to a good many. At Stamps Cross, just before Cambridge, we caught the Austin car busy with tyres, so we took Ebbelwhite on to set the watch at Cambridge. On the way to Huntingdon E. J. Bass, the trials secretary of the Essex Motor Club, was seen trying to pulverise the twenty-four hours' pedal tricycle record. Several suffered trouble before Huntingdon. Parsons had belt trouble, but was nevertheless in to time. Pratt could not get his lamp to burn, and was compelled to retire. He rode to Grantham, and spent the rest of the day assisting with the checking. Apparently the whole population of Wansford Bridge had turned out to take the times there, and all the competitors got a good cheer as they pulled up. At Stamford one enthusiast had put up a big notice "To York," and there was no difficulty in finding the Colsterworth Road. At Grantham everyone was ready for the hot supper at the George. Deacock, Pershke, and Krause had fallen out from unknown causes.

From Grantham to Doncaster was the most trying part of the journey, as there was a very thick fog, and several men lost their way. Five miles from Doncaster the riders were stopped for a secret check. Ferrybridge was the only place not properly marked. The following checked in at York: Janssen, the two Hardys, Cooper, Wells, Evans, Wood, Fletcher, Smith, Peppercorn, the two Applebees, and Hill. Parsons had run out of petrol near Doncaster in consequence of having lost his way in the fog, and this, coupled with belt troubles, caused his retirement. Peppercorn had been in collision in the fog, and had to be medically treated at York.

On the return journey the unfortunates were picked up. Siffken found that he was out of the running, and instead of returning to town started off for Scotland for a holiday. A secret check was placed five miles from Doncaster. The fog had now cleared off, and it was very pleasant running. Lunch was served at Grantham. Here we learned that the Austin car had got as far as Retford, and had there experienced more trouble, which had caused another stop. At Stilton there was a secret check being worked by Pratt. At Woodford a large crowd had again assembled, and the

following men were checked in within twenty-four hours: Janssen, F. A. Hardy, W. Cooper, Wells, Lee Evans, Wood, Fletcher, Smith, Peppercorn, F. W. Applebee, and Hill. The final results will be issued when the committee have examined the whole of the time sheets. In a competition of this nature, where times are taken at secret checks as well as the known places, it is impossible for the results to be known until the committee have had an opportunity of going through the figures.

W. H. Bashall asks us to state that the reason he made comparatively slow time in Class 2 at Newnham on August 21st was because the petrol pipe of his 7-8 h.p. Bat-J.A.P. unfortunately broke.

Some of the riders who took part in the Twenty-four Hours Run of the Essex Motor Club on Friday and Saturday last. Our photograph was taken at Woodford.

TOURIST TROPHY RACE.

THE following are the entries received up to date for the Motor Cycle Tourist Trophy Race, to be held in the Isle of Man on September 23rd:

The entries total forty-eight, and it is confidently expected that the number will reach between fifty and sixty before the list closes this evening.

J. Marshall (3½ Triumph) (holder)	A. J. Sproston (5 Rex)
H. Reed (5 Dot) (holder of Twin Trophy)	Jas. Adamson (3½ Triumph)
Norton Mfg. Co. (3½ Norton, 496 c.c.)	L. C. Munroe (5½ N.S.U.)
Noel E. Drury (5 J.A.P., 630 c.c.)	R. M. White (3½ Brown)
C. B. Franklin (7½ Triumph)	R. M. Brice (3½ Brown)
W. H. Wells (5 Indian)	J. Baxter (5 Rex)
W. H. Wells (5 Indian)	J. C. Smyth (3½ Rex)
S. C. Perryman (5 Norton)	R. Lord (3½ Rex, two-stroke)
R. Ellis (3½ Rex)	G. E. Stanley (3½ Premier)
F. A. Applebee (Rex)	B. B. Jones (3½ Premier)
O. C. Godfrey (Rex)	Wm. Heaton (3½ Rex)
W. Grimstead (5 Rex)	H. L. Cooper (3½ Triumph)
J. F. Jones (3½ Triumph)	F. C. Bagshaw (5 Rex)
W. O. Bentley (3½ Rex)	A. J. Moorhouse (5 Rex)
C. E. Murphy (3½ Triumph)	Rein Fowler (5 Rex)
Jas. Stewart (3½ Triumph)	Thos. Greer (5 Rex)
H. A. Collier (6 Matchless)	C. Wilson (3½ Rex)
H. V. Colver (3½ Matchless)	N.S.U. Motor Co. (4 N.S.U.)
C. R. Collier (5 Matchless)	F. W. Barnes (3½ Zenith)
W. H. Bashall (Bat)	H. H. Bowen (Bat)
J. T. Bashall (Bat)	G. L. Fletcher (Bat)
Hugh Gibson (3½ Triumph)	W. Newsome (3½ Triumph)
T. A. Carter (5 Rex)	A. G. Fenn (3½ Triumph)
	P. Butler (5 Dot)
	H. D. Blake (3½ Triumph)
	W. G. McMinnies (3½ Triumph)

ARE SCRUTINEERS NECESSARY ?

By B. H. DAVIES.

A PROPOS of the recent hill-climb controversy, readers may be interested to hear my experiences as a scrutineer at the recent Coventry and Warwickshire M.C. hill-climb. In company with three or four others I was deputed to examine all the machines at the scales, and to transfer to the racing class any machines which were not tourist mounts. Our instructions were to debar any machine which did not comply with a touring specification published in the regulations. For instance, machines must have 3½ in. mudguards, spring forks, two brakes, touring saddles, standard size tyres, 5 lbs. of tools, stand, and horn. We were further supposed to see they possessed efficient silencers. These regulations compelled competitors to enter no machines which did not fit this specification. Some twenty special machines, with flimsy accessories, special tyres, frames, etc., were only entered in the racing class, although several of them had competed previously in at least half a dozen so-called tourist classes, and had proved victorious. So far the institution of a scrutinising committee was a complete success. In fact, we only objected to two machines. The nett results of employing scrutineers were, therefore, that some twenty special machines were automatically relegated to the racing class.

Efficient Silencers and Cut-outs.

In one department of our instructions we were absolutely helpless. We were instructed to see that the tourist machines possessed efficient silencers. It is impossible to judge this detail at the scales, and the rule was futile since competitors were allowed to open their cut-outs on the hill. The only satisfactory way of penalising special silencers is to seal the cut-outs at the scales, and then to post observers on the hill at intervals of fifty yards, and to disqualify any machine which is reported to be noisy by a majority of observers. It is no use testing the silencers anywhere else than on the hill, for some of the pedalless machines cannot be run on the stand at the weighing yard, and if the entrant be ordered to run his machine on the road, he will naturally throttle down the engine. This part of the regulations caused me some discomfort, as when, say, six machines of one make were brought before us,

we noticed that one or two had drilled larger holes in their exhaust boxes, whereas others were using the standard silencer. As a matter of fact, certain machines figuring in the prize list were using special silencers of the apologetic order, but the committee did not see their way to post observers on the hill when they had not announced such an intention on the schedule. I should, therefore, recommend officials at future climbs to seal the cut-outs at the scales, and to post silence observers on the hill itself during the climb. If this method had been followed at Newnham I think one or two successful machines would certainly have been disqualified.

Assisting the Genuine Amateur.

Though scrutineer committees undoubtedly are useful to the extent detailed above, it is obvious their value is limited. For instance, we had no power or opportunity to disqualify machines consisting of a special racing engine mounted in a genuine tourist frame; and undoubtedly such machines passed through our hands on August 21st. Several machines of this description were ridden in the touring class, and I cannot invent any mode of debarring them. None the less, things are better than they were. The amateur can bring to a hill-climb nowadays the machine he uses in his ordinary road work, and be assured that all the machines he has to beat will be of equal weight with his own. The only thing he has to fear is that a machine of similar make and weight may possess a racing engine; and most of the big firms are now ready to supply the amateur with one of their racing engines to special order. Whether the genuine amateur prefers this state of things to undisguised racing on the fastest machine he can buy, beg, borrow, or steal is an open question. I am inclined to think the touring class, with a committee of scrutineers to limit it, is the best alternative, for it means that the sporting amateur need only possess a single machine. If all limitations are removed, it means that the *bonâ-fide* amateur motor cyclist must be the possessor of one machine for roadwork, and another with light frame and flimsy accessories for competition work; and genuine amateurs are in the minority who can afford to own more than one machine at a time.

THE TOURIST TROPHY RACE FUND.

AS already announced, the Auto Cycle Union respectfully invites all who are interested in motor cycling to subscribe towards the above fund. *The Motor Cycle* is contributing rs. for every £1 up to £100 sent in by club secretaries or others. Contributions should be addressed *The Motor Cycle*, Coventry. Collecting sheets can be obtained from the Editor, *The Motor Cycle*, or the Secretary, the A.C.U., 8, Down Street, Piccadilly, W. We have pleasure in acknowledging the receipt of the following sums, and hope that next week the subscription list will swell to such large proportions.

	s.	d.
G. A. Burnand	1	6
Lieut. F. Hastings Bostock	3	0
L. Bunting	1	0
Thomas Greer	10	0

The A.C.U. announce the receipt of the following sums:

Cambridge University M.C.C.	£1	1	0
Collier and Son and employees	2	9	0
R. E. S. Spender		5	0
W. Cooper		10	6
Phelon and Moore and employees	1	15	6
Dr. H. R. Mayo	1	1	0
Vacuum Oil Co.	5	0	0
Dr. E. W. Brewerton	2	2	0

It is pleasing to note that the entry list promises to be large. In fact, it is already longer than that of any previous race, so that a most interesting and instructive event is practically certain. Already public interest, especially in the Isle of Man, where the race is to be run, is being centred in the event, and the hill-climb to be held on the following day.

LETTERS TO THE EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Pre-tio 1 of Th:ft.

[4225.]—I notice a correspondent, "F. H.," asks how to put his motor cycle out of action. The simplest and most effective method that I know of is to insert a dummy sparking plug (i.e., one with the points broken off). I have heard of a case where this remedy was the means of hauling and securing the thief.

H. N. D.

Hotel Accommodation and Charges.

[4226.]—There are plenty of small hotels with usual home comforts and tariff of, say, 3s. 6d. to 4s. for plain but substantial tea, clean beds, and meat breakfasts, boots, etc., in most towns and fair-sized villages, but many of them lack accommodation for motor cycles. Arrangements could, however, be made for storing them in cycle depots or covered yards in the immediate neighbourhood, and I would suggest that a suitable form be issued to tourists, and more particularly commercial travellers who work their ground on motor cycles, to place with the proprietors of such establishments, a list to be compiled from those who were willing to make terms.

Y 168.

[4227.]—I am glad you have voiced the question of hotel accommodation and charges. Last summer I had the misfortune to be stranded late at night and was overcharged, but by threatening to report the matter to one of the motor organisations I obtained a rebate. Another motorist, when charged 6s. for a cold luncheon, adopted the plan of paying half-a-crown and giving his card, saying they could summon him for the difference, with the result that he heard no more of it.

At the same time, I think you ought to voice the matter of extortion which garage proprietors make for attempts at repairs to motors. I recently had the misfortune to get into one of these shops, where they kept my machine for three weeks, altered the inlet valve so that the engine caught fire twice, and nearly lost me the machine, lost me over 12s. worth of tools, and in the end I had to send two men with a car to tow it back, and for all this I received a bill for £12 odd. It took two men a week to put the machine to rights.

This is not the only occasion, as I had similar extortion meted out to me when buying a new cylinder top for an Antoine engine, and again when exchanging an old engine and cash for a new one, which turned out to be faulty. There seems to me to be more sharks awaiting the novice in things pertaining to motors than ever existed in horse dealings.

I am glad to note the formation of "The Autocar League," which organisation will I hope help to counteract the evil ways of such men. As things are, it is driving men out of the field and bringing the whole trade into disrepute. Unfortunately, I notice a spirit of cowardice in the motor journals, as they attempt to keep back from the public the fact that such proceedings are going on.

THECLA W. ALBUM.

[The Deposit System is open to all readers of *The Motor Cycle*, and is especially recommended when dealing with unknown persons.—Ed.]

The Lightweight Question.

[4228.]—I have been riding a $5\frac{1}{2}$ h.p. motor bicycle for the past six months with a friend whose cycle is only $1\frac{1}{4}$ h.p. His work was quite easy as regards starting and handling the machine generally, and he seems to keep with me on hills, etc., without any trouble. I have since invested in one of these little machines and find motor cycling is quite a pleasure to me. I have a motor bicycle now not a car on two wheels, and would not go back to the heavy weight for anything.

PLEASURE.

No Fortune waiting in Glasgow.

[4229.]—I hope you will allow me space to refute the statements made by "Glasgow Motor Cyclist." The number of motor cyclists in Glasgow is extremely small for three reasons. Firstly, the weather conditions. We seldom have a week without rain in summer; in winter it rains every day. Secondly, up to last year no machines were made that were really suitable for Scotch roads. Thirdly, all Glasgow lives in flats. This means that machines must be kept at a garage—always a fairly expensive item. I hope I have made it clear why it is impossible for any firm to make a fortune out of motor cycles in this town, or to keep a large stock of spares.

G 1361.

[4230.]—I was somewhat surprised to read the letter from a Glasgow motor cyclist in last week's issue of *The Motor Cycle*, for while in Glasgow in May last it was my good fortune to find there a large establishment devoted almost exclusively to the sale, storage, and repair of motor cycles. I refer to Templeton Bros., Sauchiehall Street. I saw there more machines of different makes stored and being overhauled and repaired than I have ever seen at any other garage; a complete factory, with enamelling and plating plant, was in full swing, and many of this firm's own specialities such as lamps, brackets, brakes, stands, etc., were being manufactured. I was pleased to see that the mechanics were real motor cycle men, and not, as is so often the case, "car men," who look at the motor bicycles as small fry, or cycle makers who call themselves experts, but are far from it.

The T. B. garage is opposite Charing Cross, so could hardly be more central, and the wonder is that a "Glasgow Motor Cyclist" has not noticed the very place he appears to be looking for. As for making a fortune out of the business, all I can say is that, judging by what was charged to me for what work was done for me, there is no fear of this particular garage being closed on that account for many many years.

J. VAN HOOYDONK.

A Motor Driving Wheel.

[4231.]—Why not a motor driving wheel? A pedal bicycle weighing 25 lbs. will carry a rider at 30 m.p.h. A tandem weighing under 40 lbs. will carry two riders at this speed. A light engine weighing, say, 30 lbs. will supply the power to carry a bicycle and rider up a steep hill. Yet a motor car to carry four passengers may weigh two or three tons and cost £500. It is a monstrous machine. Why? Is it not because as soon as the frame is placed upon four points of support the frame must be stronger and heavier, the engine

The City Motor & Cycle House,
NEWGATE ST., LONDON, E.C.

RELIABLE ACCESSORIES AT
London's Lowest Prices

THE NORTH ROAD DUST AND RAINPROOF OVERALLS.

These meet a long-felt want; they can be instantly slipped on over the ordinary trousers, they fasten round waist with a leather strap and buckle. Being made in one piece they are a great protection to the stomach, also it is impossible for the rain to drive in as with the ordinary overalls. Made in three lengths—short, medium, and long. Shaped to go over boot. Patent Side fasteners. Price, in fawn waterproof material, 16s. 6d. Postage 6d.

THE "ACME" WATCH HOLDER.

Will not rust. Made in aluminium. Will fit all handle-bars. Complete with sapphire watch that is specially constructed to stand vibration. Watch can be set and wound without removing same from case. Each watch has a written guarantee given with it for 12 months. Price, complete, 8/6. Case only, 3/6. Post free.

THE LODGE PLUG.

Suitable for magneto or accumulator ignition. Spark brought well away from all cold metal surfaces, enabling maximum power to be obtained from spark and extremely weak mixtures to be fired. Three spark points and centre rod all of absolutely pure nickel and substantial in size. The spark will not burn them away. Porcelain sleeve round central electrode, which keeps hot enough to prevent the deposit of soot or any condensation, and this without the possibility of preignition common to plugs with projecting porcelains. Each plug guaranteed. Price 4/-. Post free.

TYRES.

The Clincher A Won Rubber-studded Cover, size 26 x 2 or 26 x 2 1/2 in., 8/11.

The Bates Rubber-studded Cover, 26 x 2 in., 8/11; 26 x 2 1/2 in., 30/6; 26 x 2 3/4 in., 37/-.

The Grose Steel-studded Cover, 26 x 2 in., 10/-; 26 x 2 1/2 in., 34/-; 26 x 2 3/4 in., 39/-.

Special Clearance Line of Continental Covers. Price, 26 x 2 or 26 x 2 1/2 in., 18/11. Postage on covers, 6d.

BOWDEN HANDLE-BAR CONTROL LEVERS.

Sing gear only, 4/6; ditto, with 4ft. of combined cable and stop, 6/4. Double lever, 6/-;

ditto, with two lengths each 4ft. of combined cable and two stops, 9/8. Post free.

THE HUNT MAGNETO COVER.

Manufactured of best patent leather, far superior to rubber as it does not crack or perish. Will fit all types of magnetos.

Price 2/-. Postage 2d. extra.

Protects the magneto from dust, dirt, rain, etc.

The H.S. All-rubber goggles, including one pair each of smoked and plain glasses. Price 1/11. Postage 2d.

Illustrated Catalogue Free.

City agents for the MINERVA MOTOR CYCLES. All models on show. Immediate delivery. Cash or instalments.

The Minerva improved 1909-models, fitted with Lucas magneto ignition, sent out for cash, complete with Lucas 1909 lens mirror projector, Lycett new toolbag with tool roll, loud horn, Lycett carrier, Price's stands, bag of tools.

Cash Price, with Bosch ignition—2 1/2 h.p., £36; 3 1/2 h.p., £37; 4 1/2 h.p., £45; 8 h.p., £48 10s. Catalogue post free.

The "WOLF" MOTOR CYCLE. ALL BRITISH Manufacture. England's Premier Lightweight. Supplied on the Instalment System.

SPECIFICATION. Engine—A. J. Stevens' 1 1/2 h.p. R.A.C. formula over 2 h.p., bore 2 1/2 in., stroke 2 1/2 in. Carburettor—New design, spray, float feed with adjustable air lever and throttle. Belt—Best chrome leather. Jockey Pulley—Ball bearing, with adjustment for taking up belt when riding. Coil—"Fuller." Accumulator—"Premier." Controls—Valve lift and switch from handle-bar. Ignition air and throttle from tank. Tank—Petrol capacity, 5 pints, sufficient for 70 miles. Oil capacity, 3 pints, sufficient for 112 miles. Frame—Specially built of the highest grade materials. Wheels—Best tangent, 26 in. Tyres—"Wasp" No. 1, 1 1/2 in. diameter, fully guaranteed; made specially by the Dunlop Rubber Co., Ltd. Brakes—Powerful roller or inverted levers to front and back wheels. Finish—Best black enamel, four coats, lined in two colours. Weight—About 70 lbs. Price £19 19 0. Full range of models on view. Free trials arranged.

City agents for MILLS & FULFORD SIDECARS. Stocked to fit all makes of motor cycles.

Prices from £7 19s. 6d. Immediate delivery. Catalogues post free.

The "COMPACT" TOOL ROLL.

Size 15 x 7 1/2 in. A useful little accessory, keeps all the tools clean and separate. Can be carried in the ordinary tool bag, is fitted with pocket for spares, manufactured of soft pliable leather and has strong leather binding strap. Price 3/-. Postage 2d.

THE R.O.M. PUNCTURE PROOF COMBINATION RUBBER AND STEEL NON-SKID COVER.

Give absolute immunity from skidding under any road conditions. Are long of life, and yet resilient. Are capable of being ridden equally well in summer or winter. Present the greatest possible resistance to puncturing materials, and yet have no leather in its composition (leather making the tyre "dead").

Price, 26 x 2, 52/-; 26 x 2 1/2, 55/-; 26 x 2 3/4, 57 6; 24 x 2 1/2, 53/-;

24 x 2 3/4, 54/6; 28 x 2, 54/-; 28 x 2 1/2 in., 60/. Carriage paid.

THE COWEY SPEED INDICATOR & MILEAGE RECORDER (Guaranteed).

Protection from Prosecution.—To the careful rider the Cowey is invaluable, for the exact rate at which the cycle is travelling can be seen at a glance, and it is impossible to unknowingly exceed the maximum legal speed. Motorists generally know the difficulty of correctly estimating the speed at which they are riding, and have been "trapped" when travelling—as they imagined—well within the limit.

Registers a speed up to 60 miles per hour. Mileage recorder registers up to 10,000 miles, then automatically starts again.

The indicator can be easily attached by

any motorist, and once fitted requires no attention or adjustment whatever. It will continue to render good service as long as it is attached to the cycle, for it is constructed throughout of the best and most suitable materials by expert British mechanics at Kew Gardens.

Price, in Nickel, 84/-, carriage paid.

THE NEW MODEL MUD PROTECTOR.

With Side Wings.

Manufactured of best patent leather, strengthened with iron supports. It is attached by means of thumb screws to front mud guard, and can be fitted to any make of machine in one minute; protects both rider and motor from all dust and mud thrown up by the front wheel.

Price 5/-.

Postage 4d. extra.

THE "PATCHQUICK" REPAIR OUTFIT.

Containing "Patchquick" patches, which amalgamate with the tyre, and are not affected by heat

or friction. Used in conjunction with the "Patch quick fix," a repair can be executed that is equal to any vulcanising process. Price 3/-. Post free.

must be more powerful, tyres and wheels must be heavier, springs must be stronger, and so on, until the 40 h.p. car is the outcome? It would seem as if the really light fast car were impossible. Witness the progress of Phoenix Motors, Ltd., from the car on cycle lines to the car on car lines. But if two pedal bicycles or two tandems were placed side by side and a separate driving wheel carried the motor and tanks—placed by preference between the two back wheels of the cycles—a light passenger machine with light frame, light wheels, light tyres, and at light expense would be evolved. Two bicycles would carry the riders, and only the driving wheel would be relatively heavy and require a relatively heavy tyre.

Perhaps some of your expert correspondents can say if two Moto-Rève engines, placed one each side of, or suspended from, the axle of the driving wheel, would not be sufficient to carry four riders up a gradient of 1 in 6. If so, why not a motor driving wheel? C. S.

Irish End-to-end Record.

[4232.]—With reference to the description in last week's issue of *The Motor Cycle* regarding my ride in the Irish End-to-end Record, I would like to say that the route I took was believed by me, and others whom I consulted, to have been the one used by all who have made attempts on the record, as well as by Mr. A. J. Kettle, the late holder. As regards this route being shorter and the roads better, this is not so. I used a Cowey speedometer, and I find the

The Irish End-to-end Record. C. E. Murphy checking and having the tanks of his Triumph replenished at Cork on August 16th.

distance to be almost the same; but as regards the roads, I am perfectly satisfied that I could make a great deal better time *via* Dublin than by the route I took. The roads from Portarlinton (forty-eight miles) are not nearly so good, and even putting this on one side you have to traverse a number of very narrow country roads with nothing but turns, which really means that you are only able to average about twenty.

I can speak with experience of both routes, as I was a competitor for the Palmer Cup Trophy on the 13th ult., which I succeeded in winning (and not knocked out in the hill-climb as stated), besides the coveted medal presented by *The Motor Cycle*. C. E. MURPHY.

Police Methods against Motorists.

[4233.]—In *The Autocar* of August 7th there is a good deal with regard to police persecution of motorists. On page 222 are the following words with regard to Perth and Forfar, "Police activity is very virulent—and not too scrupulous." Now could not your valuable paper give, say, at the head of Current Chat a weekly list of counties in which this extravagant persecution is carried on. I am sure that if all motorists were to make a point of carefully avoiding such counties the loss to tradesmen in those counties would be so great that their outcry in consequence would have its effect on the police.

At the same time to show that I have no prejudice against the police as a body, who are thoroughly dutiful men, I

should mention that I have personally never come to trouble through them and have always found them most obliging.

I think myself that most of the trouble is owing to that small section of the motoring fraternity, "the road hogs."

Also to a certain extent it is due to ignorance of one's own speed. Before I got a speedometer I honestly thought I was going at 10 m.p.h. or less in villages, etc., but since investing in one I found that my machine (a twin) would not fire at less than 15-18 m.p.h. with any regularity. Since then I have parted with that machine and got one more amenable to orders.

In conclusion, I would sum up as follows:

First.—Let all motorists shun counties where trapping seems overdone or unfair.

Second.—Let all motorists combine against the road hog, even to the extent of informing the police.

Third.—Let everyone be in a position to estimate his speed accurately, by speedometer or otherwise.

I am in no way whatever connected with the sale or make of any speedometer. E. F. L.

Sunday Competitions.

[4234.]—Replying to letter No. 4210 regarding competitions held on Sunday—personally I am in favour of Saturday competitions, and can take part on either day. However, when a club is organising a programme of events the wishes of the members have to be studied. I do not know whether "Anti-humbag No. 2" knows the position of the members of the Western District M.C., but I will inform him. The very large majority are connected with business, which prevents them taking part in competitions held on Saturday. That is our sole and only reason for holding our competition on Sunday. "Anti-humbag No. 2" appears to know the feeling in the club more than myself towards the A.C.U. in this matter. Is he aware at the half-yearly meeting of this club the resolution passed by the A.C.U. was strongly condemned by all present with only one dissentient?

With all due respect to "Anti-humbag No. 2" there is a touch of glory about his views. He appears to think a competition cannot be held unless riders wear armlets and machines carry numbers, and there are flags and bunting at the start and finish, which to me seems quite unnecessary.

I fully appreciate the value of the A.C.U. as a governing body, but consider the resolution passed most unreasonable, and trust same will be rescinded in the near future, as Sunday events are in no way detrimental to the pastime.

HARRY E. VOWLER,

Captain Western District M.C.

Petrol Consumption.

[4235.]—Are the performances of the first and second machines in the consumption trial held by the Nottingham and District M.C.C. on the 14th ult., and described in *The Motor Cycle* of the 18th, in any way miraculous?

It appears that the winner, a 5-6 h.p. twin Brough, with cylinder capacity of 662 c.c., averaged between 16½ and 19 m.p.h. over a circular course, doing sixty-six miles on 2 pints 15 ounces of petrol. This works out at 192 miles per gallon, and, supposing the gear to have been about 4 to 1 and road wheel 26in., is equivalent to about eight explosions per minim of petrol. The performance of the second, a 3½ h.p. Triumph, is little less remarkable, this machine having averaged 211 miles per gallon.

I do not know at all what the course was like or whether any hills had to be climbed, but the circular course precludes any help from the wind. I should have thought that in ordinary practice 115 miles per gallon was very good for a twin of 660 c.c., and 130 miles per gallon rather unusual for a 3½ h.p. Triumph.

The performances quoted above are so very much better than the average that it could hardly fail to be of considerable interest to many of your readers to hear how it is done. The speed, of course, is much lower than the average of such machines on the road, but the petrol consumption is almost exactly half the touring average of a well-timed machine. The other four 3½ h.p. machines in this particular trial averaged 127 miles per gallon—a most remarkable difference from Nos. 1 and 2.

We should all like to be able even feebly to emulate these performances of Messrs. Brough and Reilly. From London to Edinburgh on something under two gallons of petrol for a 3½ h.p. Triumph would be really economical.

F. C. JAMES.

Motor Cycle Taxation.

[4236.]—The Motor Cycle Committee of the Motor Union have had under consideration how they might best combat the proposed excessive taxation on motor cycles. Amongst other suggestions put forward was one that, inasmuch as the text of the Finance Bill apparently makes no distinction between machines of the type of the Motosacoche and heavy tricar, a tax of so much per unit of h.p. would be much fairer than a tax of £1 all round. This idea has the great merit that it would give relief to the riders of low-powered lightweights, and also to that class of riders by whom taxation is most severely felt, viz., those who have purchased old machines (second-hand) for a few pounds. I have not the actual rating of all machines before me, but I should imagine that a tax of 2s. 6d. per h.p. by R.A.C. formula would work out roughly somewhat as follows: Lightweights not exceeding nominal 2 h.p., 7s. 6d.; old machines 2½ h.p., 10s.; modern machines 3½ h.p., 12s. 6d.; twins (unlimited), £1. I should very much like to have the opinion of individual riders on this point.

F. W. HASSARD-SHORT,

Chairman Motor Cycle Committee of the Motor Union.

[It is only fair to state that the above letter was unavoidably held over for two or three weeks.—Ed.]

The Newnham Hill-climb.

[4237.]—I think all true sportsmen must have felt a little disgusted at the amount of grumbling heard from certain unreasonable competitors at the recent Coventry and Warwickshire M.C. Climb—grumbling which has been the sequel of several climbs this year. It seems to be the regular thing for a handful of riders to growl whenever they do not win. Although I did my best I did not have the luck to win a prize at Newnham myself, but I must admit I thought the event exceedingly sporting, and was not a little pleased at certain novelties in the arrangements.

At the average open hill-climb we see phenomenal speeds registered by a little group consisting principally of trade riders. The venue of the hill has generally been semi-public knowledge for weeks, and these experts visit it in advance, arrange their gear, etc., to suit that particular hill, and as a consequence they divide the prizes amongst themselves to the exclusion of the amateurs or the struggling trade riders who have come from a distance and have perhaps never seen the hill before.

The Coventry Club surprised those very wide-awake gentry. It refused to publish the venue, and all that competitors knew was that they would have to climb an unknown hill. The wide-awake group took it for granted that Newnham would be the venue, that the start would take place in the village at the foot, and that they would have a known distance and gradient upon which to work up speed. When they got on the hill they found they were to be started two-fifths of the way up, so that they only had about fifty yards of 1 in 25 in which to get up speed, and that all their real travelling was to be up a real hill. As a consequence they were all caught napping with standard gears which were too high for the job, and were beaten to the wide by machines prepared to face any gradient, and that, if necessary, from a standing start.

In other words, they found themselves in exactly the same position as any amateur who suddenly encounters an unknown hill-climbing job on his tour. One would have imagined they would have been sportsmen enough to grin at their own discomfiture, especially as they were all in the same boat, but not a bit of it. They are accustomed to have everything cut and dried at a hill-climb so that they can make sure of dividing the prizes between them, and when on one single occasion in the course of several years a sporting club so arranges matters that there is an absolutely fair field and no favour, the air is blue with furious complaints and innuendoes.

Personally, I devoutly hope that other clubs will adopt a similar plan, and make it impossible for a select few to rely on scooping every award in the list. It would possibly be to the advantage of both the sport and the industry if some of these men who grumble were permanently to abstain from competitions and leave the events to be contested by men who know how to take an occasional licking without growling.

UNSUCCESSFUL COMPETITOR.

Surface Evaporation.

[4238.]—The letter of "Cygnus" interested me a good deal, for I gave a lot of attention to the question of surface and spray carburettors in the early days (1900-1902) of motor cycles. The "surface" was then very unfairly condemned by many riders. When any trouble arose the carburettor was blamed, but the fault was generally with the ignition.

About this time I built several precisely similar machines, fitting some with surface and others with spray carburettors, and found the "surface" ones always pulled far better on hills, and proved the more satisfactory machines to their owners. The chief point I consider in favour of the surface is that it traps the road dust, and the life of the cylinder is more than doubled. I had one little 1½ h.p. engine surface machine through my hands that did over 20,000 miles before the original set of rings was renewed. On the other hand, I have known a 2 h.p. engine with spray carburettor fitted rather low down in the dust that required a new set of rings in less than 1,000 miles, and the cylinder was completely worn out with the first year's riding.

The dust trouble is even now on up-to-date machines not fully guarded against. It is a curious thing that I have never seen the matter alluded to in any motor paper till about twelve months ago, though I am sure the free entrance of dust into the cylinders through the carburettors must have caused a lot of undue wear in the bulk of motor cycle engines. Possibly dust may have some relation to the wear on the cylinder spoken of by other correspondents.

L. S. HICKS.

Standard Machines in American Competitions.

[4239.]—I have followed with interest the discussion in your paper on the subject of standard machines in competition. It is evidently very much the same in England as it is in America. In this country the really important motor cycle events are won by trade riders mounted upon special racing machines. These racing machines are very different from the standard product, being very much lighter, having engines of higher compression and differing structurally in several important points. Furthermore, I hardly see how any different results could be expected. In motor cycle competitions you can hardly blame the manufacturer if he tries to get the very highest possible speed from a given cylinder capacity. Furthermore, from our experience we have found it is almost impossible to draw a sharp line of demarcation between the standard touring machine and the special racing one. This is due to the fact that what one man considers a standard touring machine another may not. Many of our riders prefer to ride as a touring mount the racing motor cycle. Many of our riders, probably like many of yours, wish to be in the position to be always ready for a road race. On this account they prefer to ride a light machine driven by a special high compression engine.

In our Federation of American Motor Cyclists we practically govern everything by piston displacement and let the best man win. We believe this is the only solution of the difficulty. Make your private owner class, and make your rules so strict that only private owners can ride; but if they are private owners of their machines let them do anything they wish to their mount.

Our definition of a private owner is:

"A private owner is one who has never competed in motor cycle competitions as a trade rider; who actually owns the motor cycle used in competition; who is not connected in any way, either directly or indirectly, with any person, or firm who manufactures, assembles, sells, or repairs motor vehicles; who has never received, either directly or indirectly, any compensation whatsoever for engaging in motor cycle competition or exhibition, or who has never sold or in any way realised pecuniary benefit from a prize."

E. L. OVINGTON, President F.A.M.C.

SUMMARY OF CORRESPONDENCE.

Will the gentleman who left a motor cycle for a small repair with the N.S.U. Motor Co., 186, Great Portland Street, W., bearing the registration number LC 472, kindly communicate with the Editor?

EXPERIENCES WANTED.

"A. B. V." Launceston, would like readers' experiences with the 3½ h.p. Minerva, particularly as regards hill-climbing and wear on engine.

"The alternate steel and rubber studded tyre."

SCOTT NON-SKID COVER

GRIPS!

THE SCOTT

NON-SKID MOTOR
CYCLE COVER,

"The alternate steel and rubber studded tyre."

BRITISH MADE
and
Unsurpassed for strength and durability.

WILL NOT SKID ON WET OR DRY ROADS.

Constructed with rows of alternate steel and rubber studs, which cannot tear out or damage cover by rust—in short, it is a "perfect" tyre, which reduces the risk of puncture and side-slip to a minimum, and makes motor cycling a pleasure on all roads.

TELCO.

The Only Coupler on the Market . .

WHAT A MAN WHO SELLS THEM SAYS:

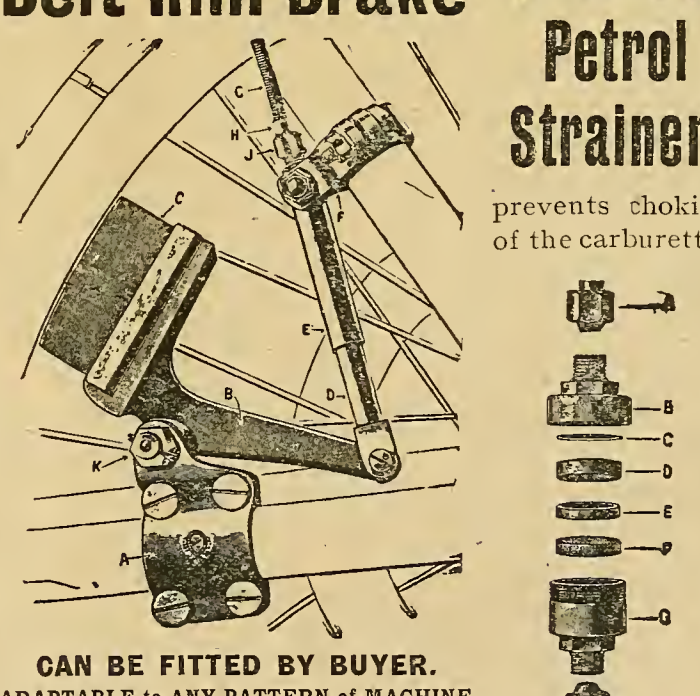

"I should be glad if you will let me have the Telco Couplers ordered on 'phone to-day as soon as possible. I have been riding for the last two months, and have covered 1,500 miles, and find that it is absolutely satisfactory. It steers easily; my arms do not ache so much after 200 miles run with Coupler as they do when riding singly. Your Coupler is far in advance of any other make, both in design and workmanship, and it is a pleasure to sell an article of this kind."

W. E. BOYCE, 23, Grand Parade, Highgate, N.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—9d. per line of 8 words; minimum, 10 lines. Name and address must be counted.

Two lines (16 words or less) costs 1/6
Three lines (24 words or less) costs 2/3
Four lines (32 words or less) costs 3/-

In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Thursday morning, or if sent by London (20, Tudor Street, E.C.), by the Wednesday afternoon previous to the date of publication.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

Plan showing division of England into Sections.

NUMBERED ADDRESSES.

For the convenience of advertisers, letters may be addressed to numbers at "The Motor Cycle." When this is desired, 2d. will be charged for registration and three stamped and addressed envelopes must be forwarded for replies. Only the number will appear on the advertisement. Replies should be addressed, 20, c/o "The Motor Cycle," Coventry"; or if "London," added to the address, then to the number given. "The Motor Cycle," 20, Tudor Street, E.C.

DEPOSIT SYSTEM.

Persons who hesitate to send money to unknown parties may deal in perfect safety by availing themselves of the Deposit System. If the money be deposited with "The Motor Cycle," both parties are advised of this receipt upon intimation of the arrival and acceptance of the goods, the money is forwarded less a charge of registration. The time allowed for a decision after receipt of the goods is three days. For all transactions exceeding £10 in value, a deposit fee of 2s. 6d. is charged. Deposit matters are dealt with at Coventry, and all bank and money orders should be made payable to Illions Limited.

SPECIAL NOTE.

Readers who reply to advertisements and receive answers to their enquiries are requested to regard this as an indication that the goods advertised have already been disposed of. Advertisers often receive many enquiries that it is quite impossible to reply to by post.

3½ h.p. PHELON & MOORE with Sidecar, two speed and magneto.....	£35 0
1908 4½ h.p. Twin MINERVA, Roc gear....	£32 0

£3 deposit and balance in weekly payments of 5/- secures a good reliable motor cycle up to value of £11.

TOURIST TROPHY WINNERS.

1909 Twin ROC, two speeds	£57 15
1909 Twin VINDEC	£64 0
Four-cylinder F.N., 1908 model	£27 10
1908 Twin REX DE LUXE	£32 10
Twin REX DE LUXE, two speed.....	£32 10
6 h.p. Twin ANTOINE, ROM	£16 0
5½ h.p. Twin REX, spring forks	£17 17

BROWN AND BARLOW and **AMAC** Carburetters, with handle-bar control. B. and B., 30/-; Amac, from 29/-. **BIG EXCHANGE ALLOWANCES.**

£6 **TOP-CLASS SIDECARS** to suit any make. Beautifully plated, enamelled, and upholstered; to suit right or left side; three-bolt fastening, 2½" best make tyre.

MISCELLANEOUS.

Three-note Horns, shift a "Loco"	8/-
The Latest in Headlights	16/6
The Latest in Magneto Cut-outs.....	2/-
Lever Belt Punches	2/3
Screw Belt Punches	1/6
Ignition Plugs from	3/6 to 9d.
SYRENS—"What a shriek"	6/11
Second-hand XL'ALL Spring forks	11/6
Duck-voiced Horns, double twist	5/3
MINERVA Spring forks, as new	£1 17 6
COWEY SPEEDOMETER	£4 4 0
New XL'ALL Spring Forks	17/6
Swan-neck Seat-pillars	4/-
Separate Generator Headlights	8/6
Rex Pattern Handle-bars, heavy gauge ..	6/6
Enamelled Mudguards, complete with stays: 3in. 2/11, 3½in. 3/6 per pair.	

TYRES. NOT MAKERS' THROWOUTS.

ALL NEW AND PERFECT.

All except 26 x 2½, 19/6.

24 x 2½ and 26 x 2½, 20/6.

ALL BEST MAKES. Send for Lists (free).

LEEDS.

CARS FOR SALE.

ECLIPSE.—20-32h.p. Darracq, two ignitions, lux body, canopy, two screens, perfect; £165.

ECLIPSE.—14h.p. Star, 4-cyl., M.O.V., side trance, splendid order; £95.

ECLIPSE.—12h.p. National, 3-cyl., 2-seater, hood good condition; £45.

ECLIPSE.—6h.p. Siddeley, 2-seater, pressed frame, splendid order; £52.

ECLIPSE.—10-12h.p. J.P., 2-cyl., side entrance chassis, hood, perfect order; £80.

ECLIPSE.—14h.p. Brooke, tonneau, 3-cyl., three in excellent order; £36.

ECLIPSE.—9-11h.p. Clement, 2-cyl., M.O.V., ton excellent condition; £65.

ECLIPSE.—6h.p. Vauxhall, 2-seater, three speed reverse, very good condition; £18.

ECLIPSE.—14h.p. Forman, 4-cyl., side entrance pressed steel frame; bargain, £105.

ECLIPSE.—10-12h.p. Gnome landaulet, four seat, splendid order; £92 10s.

ECLIPSE.—9h.p. tonneau car, 1-cyl., in good running order; £25.

ECLIPSE.—6h.p. Humberette, 2-cyl., three speed good little runabout; £22 10s., bargain.

ECLIPSE.—7h.p. Pope-Tribune, 2-seater, £32.—E Engineering and Motor Co., 255, Earlsfield Wandsworth. Phone, 1135 Putney.

GENTLEMAN'S Handsome 4h.p. M.O.I.V. To Model (V.S.82), dual magneto, accumulator tion, 26in. by 2½in. Peter-Unions, Riches detach live axle, foot clutch, electric light, very low, 14 length; 22 guineas; photo.—North Lodge, Teddington London.

4-SEATED Car (Decauville), 2-cyl., cardan drive, drive on top, four speeds and reverse, D grooved tyres, two spare covers, non-skid on back, plate with lamps, in perfect running order; can be and tried any time during the next two weeks at Rochester Rd., Earlsdon, Coventry.

1908 6-7h.p. Laurin and **Klement** (develops 1 more), 2 cyls., magneto, thermo-syphon, spares, equal new, little used, well cared for, small most reliable 2-seater on the road; 100 guineas for immediate sale; convincing trial; motor cycle or part payment.—Stanton, 619, Lea Bridge Rd., Le London.

INSURANCE.

PLEASE Send for full covering Motor Cycle Insurance from 18s. 6d. per annum.—Bass, Insurance Bro. Ongar.

INSURANCE for Motor Cycles of every description arranged by Hugh J. Boswell, Insurance Broker, Norwich; fire, 2s. 6d.; third party, 7s. 6d.; accident, 15s.; please write for particulars.

TUITION.

MOTOR Car Driving and motor tyre repairs taught in one month.—Particulars, Stimpson, Stratford Avon.

MOTOR EXPERTS.

IMPORTANT!—Colonial, foreign, and country repairs should communicate with R. Nye, Aldhurst, Istead Rd., Streatham, London.

BUSINESSES FOR SALE.

CYCLE and Motor Business (small), showing living profits, country market town; stock, fixtures, etc., £120, or offer; part exchange high motor cycle.—Particulars, 96, Ridley Rd., Forest London.

MOTOR and Cycle Business for sale, established years, main road of growing market town of 13,000. good house, with gateway—entrance to w stock and fixtures about £300.—Address, Box 3,061 Motor Cycle Offices, Coventry.

MOTOR and Cycle Business for disposal, main S.W.; garage for 12 cars, three inspection large front shop, house, and garden, workshops, complete equipment of tools, etc.; house arranged separate half houses, producing £30; splendid dist everything at valuation; owner retiring; low rent Letters, 5, Crewsdon Rd., Kennington.

ENGINES.

2½h.p. Engine, Kelecom, like new, perfect order **2½** worn; £2 17s. 6d.—W. Ledward, Pentrich, I

3½h.p. Aster, good condition, heavy flywheels, o **3½** gills, also B.O.M. contact.—Taylor, Shipbo Tonbridge.

6h.p. Twin Kerry Engine, fitted with carburetter, control, silencers, etc.; £9 10s.—Allen, 7, Lin St., Stockwell.

4½h.p. Aster, water-cooled, in perfect order; for **4½** or exchange for 6h.p. water-cooled.—57, 1 room Lane, Sheffield.

ENGINES for cars, cycles, boats, and aeroplane. Send for particulars to the Advance Motor Co., Ltd., Northampton.

LIGHTWEIGHTS.—1½h.p. Clement, 1½h.p. Minerva, 1½h.p. Trent, 1½h.p. Minerva, 2h.p. Quadrant, 2 Buchet, etc., to clear, cheap.—Motor Accessories, J St., Coventry.

ADDRESS—20, TUDOR STREET, LONDON, E.C.

"The Autocar League."

SO many motor cyclists have written to *The Autocar* regarding "The Autocar League" that we feel compelled to address our readers again on the subject for the simple reason that most of the writers appear to be in doubt as to the motor cyclist's position in regard to the formation of the league.

As we have said before, motor cyclists are eligible to join—in fact, they are heartily welcome—and elsewhere in this issue will be found a form for motor cyclists to fill up and forward to *The Motor Cycle* offices.

To those who feel disposed to fill up and return this form to us we should like to point out that the motor cyclist's case will receive our most careful consideration, and only where their interests and those of car owners are identical will they be asked to vote.

On the other hand, motor car owners will not be asked for their vote or opinion on any matters which only affect the interests of motor cyclists.

In a few instances these interests will not necessarily be identical, but we shall know as practical motor cyclists where they are likely to harmonise and where possible discord might arise.

No one will deny that motor cyclists have to a great extent escaped the police attentions, which is one of the evils the league is to combat, in cases where prosecutors become persecutors. The reason they have escaped is probably because those who are out to persecute only desire the money paid in fines, and have not the real safety of the public so much at heart as they would like others to believe. Motor cyclists are seldom wealthy men,

and probably the police and those who instigate quarter-mile traps in ten-mile limit areas are aware of it. On the contrary, those who own motor cars, particularly large and speedy ones, must necessarily be more worth plundering. We all know that motor cyclists have not escaped scot free—some have been most unjustly fined from time to time—but generally the persecuting type of magistrate prefers a £10 fine paid by one wealthy person to ten £1 fines collected from those of more moderate income.

There is therefore hardly the same necessity for the motor cyclist's league in case of police persecution, but there are many other points where combination would prove beneficial, and on these points we think motor cyclists ought to combine.

Assisting Existing Organisations.

ANY combination or league of motor cyclists which we have a hand in organising will not interfere in the slightest with associations already existing; on the contrary, their positions will be strengthened. On any occasion when the opinion of the bulk of motor cyclists would assist the bodies which cater for motor cyclists, we shall be only too glad to render every assistance in our power by showing the secretaries or their committees, through the pages of *The Motor Cycle*, what is the unanimous desire of the members of the league.

Naturally, we shall only ask motor cyclists to vote on questions of vital importance, and, as we have already stated, in no case will they be asked to record their opinions when the matter is not of interest to them as motor cyclists. That the large number of motor cyclists will materially strengthen the

league whenever they are called upon for an opinion is obvious to anyone.

The number of motor cyclists in the kingdom must be in the neighbourhood of 70,000, and if they will adopt our suggestion and combine for the common weal the motor cyclist's condition will naturally be much improved.

The only thing we ask readers to do is to fill up the form, stating the horse-power and type of machine they use, and to give their name and address for entry

in our referendum register. The names and addresses sent to us will not be used for any other purpose than to take a vote on any important matter affecting the rights or interests of motor cyclists, and will not be used for advertisement purposes either in connection with ourselves or anyone else.

We particularly point out that the list will be kept quite private, because many people quite naturally object to the publication of their names and addresses.

MAGNETO SWITCHES.

STRANGELY enough, it is comparatively rare to see a switch fitted to the modern magneto fired motor bicycle. Every magneto of well-known make is fitted with a small screw immediately over the contact breaker adjacent to the spring holding on the brass cover of the make and break. To this screw it is intended to attach the earth wire from the switch, so that when the said wire is connected to the frame by means of the latter the magneto is shorted, and

consequently put out of action. So rare is the fitting of a switch nowadays that we are constantly receiving letters from correspondents who write to ask us if it will do any harm to fit one. Of course, this is impossible, as shorting is the only correct way "to switch off" the magneto. On all machines where the throttle is not a perfectly gastight fit a switch is advisable, as in the event of the valve lifter wire breaking it would be difficult for a novice to stop suddenly.

BROOKLANDS OCTOBER MEETING.

ON Wednesday, the 6th prox., at Brooklands, seven events for cars will be held and two for motor cycles. Particulars of the latter events are as follows:

The Autumn Motor Cycle Handicap, for motor bicycles, the cubic capacity of whose engines does not exceed 500 cubic centimetres. Starters barred. Distance about $5\frac{1}{2}$ miles.

The October Motor Cycle Handicap, for motor bicycles the cubic capacity of whose engines exceeds

450 cubic centimetres, but does not exceed 1,000 c.c. Starters barred. Distance about $8\frac{1}{2}$ miles.

In each event the entrant of the winner to receive ten sovereigns or cup at option, the entrant of the second five sovereigns or cup at option, and the entrant of the third three sovereigns or cup at option. To close September 27th, 1909, at twelve noon. Entrance 10s. 6d., p.p. Twenty-five entries, or the races may be void at the option of the executive; or, if not void, the number and value of the prizes may be reduced.

CONTINENTAL TOURING.

ONE or two queries have reached our office lately respecting the French Customs duties on a motor bicycle and sidecar. It is well known that a member, or affiliated member, of one of the motoring organisations can obtain a triptych which will pass a motor bicycle through the Customs free of charge, provided the machine is brought out of the country within three months from the date of its introduction, but it is not general knowledge that different regulations govern the introduction of a motor bicycle and sidecar. A letter of enquiry addressed by us to the Motor Union has brought the following interesting reply, which we publish for the benefit of those who may contemplate taking a sidecar to France.

- (1.) Customs.
- (2.) Taxes.
- (3.) Licences.

(1.) A motor tricycle is assimilated to a motor car, and will only be admitted into France if the amount of duty be deposited or a triptych issued by an authorised body be produced.

A motor bicycle with a forecar or sidecar is considered as a motor tricycle.

The only distinction made by the Customs between a motor tricycle and a motor car is in the rate of duty applied. For the motor tricycle it is the same as for an ordinary cycle, viz., 220 frs. per 100 kilos., approximately equivalent to 10d. per lb. On a motor car manufactured elsewhere than in the United States of America the duty is at the rate of 50 frs. per 100 kilos., equivalent to £1 0s. 4d. per cwt.

What guides the Customs in deciding whether the cycle duty or the car duty is to be applied is the weight. A vehicle weighing under 125 kilos. (2 cwts. 1 qr. 26 lbs.) is charged at the cycle rate. One weighing 125 kilos. or over is charged at the car rate.

(2.) A motor cycle is exempt from the payment of taxes for a period of three months, provided the owner obtains from the Customs officials on landing a "permis de circulation," for which a fee of sixty centimes is payable.

(3.) The law provides that no motor-driven vehicle (and this includes even motor bicycles) shall be used on the public roads in France without (i.) a certificate of registration, and (ii.) a licence for the driver. The law does not make any exception in the case of foreign drivers. These certificates and licences are granted by the officials of the Service des Mines at the principal ports, and also at the Prefecture of each department.

The certificate issued to the driver of a motor cycle is somewhat different from that issued to the driver of a motor car, but the cost is the same. On every driving licence issued to the owner of a car or motor cycle the Government claims a fee of 20 frs., and there are other subsidiary expenses for stamped paper, etc.

It frequently happens that an English motor cyclist lands in France and goes ahead without troubling to get the prescribed certificate and licence—just as a French motor cyclist or motorist sometimes lands in England without troubling to get his licences. Such a person, however, is not in order, and though it is quite likely that he will not be discovered, nevertheless, if any accident were to happen, he would—at all events in France—immediately be asked to produce his papers, and if he could not do so he would be in an awkward position. The French police agents would probably lock him up pending enquiries.

SYNOPSIS OF THE JUDGES' REPORT ON THE SIX DAYS' TRIAL.

General.

UNDER this heading the judges compare the severity of the last trial (July 5th to 11th) with the trials of previous years. The spirit shown throughout the trials by competitors was excellent, and the judges have only the complaint to make that there was too much mutual assistance, and give warning that they will enforce the rules against friendly assistance next year. They intend also to be more severe on competitors who habitually arrive at or near controls ahead of their time. Penalisation will be more against the machine than the rider, as the trouble arises partly from the difficulty experienced with some makes of throttling them down to run regularly at low speeds. Several regrettable accidents occurred entirely through competitors riding too fast in dangerous places, and their machines were damaged sufficiently to put them out of the trial.

Clothing.

The average general appearance of the riders has never been better, and competitors, with few exceptions, looked less like mechanics than formerly.

Frames.

As was the case last year, the frames, fittings, mudguards, stands, carriers, etc., were in excellent condition throughout the trial. This does not, however, apply to the sidecars, which, with the exception of the Puch, all suffered damage to their frames, and had to retire in consequence. This trouble is due to the fact that most motor cycle frames are not built to stand a sidecar attachment.

Bearings and Free Wheels.

With hardly an exception, these were all in good condition at the completion of the distance. True, there was not a great deal of rain, but there were plenty of trying surfaces to find out weak spots. There is still room for improvement in free-wheel clutches; and the Triumph guard over the hub sprocket is a step in the right direction. More than one rider complained that his pedalling gear was quite useless, it giving a free-wheel both ways.

Engines and Tanks.

With a few exceptions, the engines finished in excellent condition. Whilst the majority kept clean throughout, there were one or two which were notably the reverse. It is a point that makers would do well to bear in mind, that exterior cleanliness is an important item, as nothing is more likely to create a bad impression amongst a motor cyclist's friends—some, perhaps,

prospective owners—than the sight of a dirty engine. Several retirements were due to engine troubles, such as a broken connecting rod bearing or crankshaft, timing gear defective, or to weak tanks and tank fittings. With regard to the last-mentioned, the trouble was due to the metal not being stout enough to stand the vibration caused by bad roads, and to the fact that the tanks themselves were not firmly secured to the frame. The one machine fitted with a ball bearing to the big end of the connecting rod retired through the breakage of that special feature. In the case of the broken crankshaft, this was discovered to be due to a flaw which had apparently existed from the time the engine was built.

Transmission.

As in previous trials, the chains on the chain-driven machines came through well. They had no breakages, nor were adjustments necessary, and the chains at the

Lieut. Hart (3½ h.p. Triumph), winner of the potato race at the blue-jackets' sports on Whale Island, referred to on page 659 of the last issue.

finish were barely slack. The team prize was awarded to the Phelon and Moore machines, but it must not be concluded that their success was due to chains alone. Rubber and canvas belts were in general use, although there were several leather ones in evidence which had been cut and trimmed up specially for the hills. Many competitors carried two rubber belts—one the correct length for the higher gear, the other for the low gear for the hills—and changed them when they altered the pulley. The triumph of the adjustable pulley is complete, its use in one form or another

Judges' Report on the Six Days' Trial.—

ing practically universal, and rightly so. There are several types still remaining which are difficult to adjust with tools usually carried on a motor cycle.

Tyres.

On the whole, tyres were less troublesome than formerly, although, singularly enough, as last year, several competitors had all the misfortunes, the rest practically none. There is no question that $2\frac{1}{2}$ in. tyres are advisable for 5 h.p. and over; in fact, for general all-round riding they are an advantage for machines down to $3\frac{1}{2}$ h.p., weighing, say, 170 to 180 lbs. With a heavyweight rider big tyres are particularly necessary. Several competitors had to change their back wheel covers before the conclusion of the trial, the fabric weakening partly on the side and partly on the tread, and commencing to bulge when tightly inflated.

Lightweights.

The sensation of the trial was the splendid performances of the lightweights, and of the Motosacoche in particular. This machine successfully surmounted every hill with occasional pedalling assistance. The Moto-Rêve and Douglas machines had no difficulty keeping up the twenty miles per hour average, whilst the Motosacoche was only once late, and then not through any mechanical failure. A special feature of the Douglas machines was the normal condition of cleanliness of the exterior of the engine.

Silencers.

The judges this year, as an experiment, permitted the fitting of relief ports on silencers, but they did not permit anything in the nature of a cut-out on the exhaust pipe. With the exception of one make of motor cycle, the silencing in general was good, though still a long way short of the really quiet mount. Amongst the quietest machines in the trial were the Douglas, the Indian, and the Triumph.

Free Engines and Variable Gears.

The Triumph free engine clutch, of which there were one or two in the trial, is a simple and practical

fitment, which with a little slipping will start the machine on quite a respectable gradient. The back hub contains a miniature multiple disc clutch running in oil, as in the case of a car clutch, the extra weight in the back hub being about 10 lbs. The Mabon clutch is a somewhat similar contrivance, readily fitted to the engine-shaft. They completed the trial satisfactorily, and were in good condition at the finish. Amongst the variable geared machines the P. and M.'s came in for a great deal of attention. With the exception of one member of their team of three the hill-climbing was good—never exceptionally fast, yet with an ample reserve for emergencies. The Zenith-Gradua gear handled by one rider did very well, but the other machine of the same make was not so successful. The latter had a smaller engine, which may have accounted in part for the difference. The Humber two-speed gear made on the Roc principle would have shown to better advantage had there have been less trouble with slipping belts. As a matter of fact, the belt rims and pulleys on this make are too small—a defect which is in course of being rectified. The clutch operating the low gear required too frequent adjustment, and this defect also has since had the attention of the makers. The judges are of opinion that the spread of motor cycling depends on silence, comfort, ease of starting, and ability to climb hills under *all* conditions. They regret that there were not more variable geared machines entered; also greater variety. Motor cycles now occupy the same position that "push" cycles filled some years ago when free-wheels and two-speed gear hubs were scoffed at.

Ignition.

The Bosch magneto was practically universal, and gave no trouble. The Triumph magneto guard is an effective protection from wet and mud, but it requires the exercise of care in going up and down steps and kerbs to avoid damaging the underpart. Whilst manufacturers will persist in fitting the magneto in a low position forward of the engine protection will be necessary, or unsightly thick grease must be smeared

Motor cycling is extremely popular with officers of His Majesty's Navy. The above riders were competitors in the potato race at the sports on Whale Island. The contestants had to ride to the top of the track, take a potato from a table, and return and drop it in a bucket.

Judges' Report on the Six Days' Trial.—

on the terminals. A better position is undoubtedly required for the magneto where it will be free from wet and dust.

Lamps.

The regulation that required competitors to carry a motor cycle lamp and generator complete throughout the trial proved exceedingly valuable, for, as last year, there was a crop of damaged lamps and broken brackets, but not so numerous as formerly. The proportion of failures to successes was considerably less, showing that improvements have been effected. The chief weak points were the front hinged frame and glass and the loop at the back that slips on to the bracket on the machine. The failure of the brackets was simple; they just snapped in half, more often than not because the lamp was heavier than a motor cycle lamp need be. There was no opportunity on the present occasion to test the efficiency of the lamps, but this may be provided for next year in the Six Days' Trial.

Accessories and Novel Fittings.

The general appearance of the machines of several competitors was improved by carrying spare belts and tubes in suitably designed and specially constructed leather bags. These preserved the spares in good

condition, and they were ready for immediate use when unpacked, which was a matter of a few moments. The Bradbury machines were fitted with a useful arrangement to facilitate tyre repairs to the back wheel. The whole of the back mudguard from the seat stays to the number plate, together with the back carrier and its stays to the hub, could be removed in two or three minutes by undoing two pairs of butterfly nuts. Two useful tyre protectors were to be seen, and both gave immunity from punctures to the fortunate possessors. One was a steel band clipped to the mudguard stays and closely encircling the tread of the tyre. The other was a flexible guard suspended from the crank bracket and hanging just in front of the back wheel, almost touching the ground. The idea is that the nail tipped up by the front wheel as it goes over it stands up on end long enough for the back wheel to run up against it. The protector hanging from the bracket sweeps it away, or at least knocks it down again where it can do no harm. An interesting novelty fitted to the Advance twin-cylinder machine was a pedal operated exhaust valve lift. This fitting has its special advantage on high powered twin-cylinder motors of relieving the strain on the hand.

The judges were J. W. G. Brooker, H. G. Cove, A. Geo. Reynolds, and Archibald Sharp.

A CRITIQUE OF THE REPORT.

By B. H. DAVIES.

THE judges' report of the 1909 Six Days' Trials suffers, in my opinion, by comparison with the similar document of 1908, which was a complete novelty, both in respect of frankness and practical commonsense. However, it is instructive reading, and adds to the obligation under which the gentlemen who sign it have already placed us by their indefatigable and efficient labours in the trial itself. I make the same general complaint about it which I uttered last year—what a pity it is not even more frank! We poor journalists, with the terrors of the libel law hanging over our heads, dare not write half we know or a quarter of what we think. A single clause in the entry agreement would enable the A.C.U. judges to be absolutely outspoken, and from what I know of the sufferings of certain private owners with various details here obscurely criticised, I cannot but think that to name offending machines and offending details of otherwise good machines would be for the public weal. Those responsible for the faults would have to mend them swiftly, or lose their business, and, what is more, they would mend them, and would take energetic steps to show us they had done so.

Hardy Annual Faults.

This does not apply to every offending machine or offending detail, some of which will certainly be reformed before next year's trials; but certain faults reappear annually on the same machines with sickening consistency, yet the machines are only mentioned, and not named, in the report. There is, for instance, the machine with the adjustable pulley of the Sandow-with-a-crowbar type, perpetuated because its makers will not pay royalty on a clever patent or evolve a sound device of their own. There is the permanent free-wheel both ways, which has distinguished certain machines since the year 1 of the motor cycling era. There is the

irremovable back wheel, the inaccessible cylinder or carburetter, the dicky, frictionful brake, the flimsy lamp bracket, the inefficient front fork, the cuss-provoking stand, the unprotected magneto, etc., etc. All these have been hardy annuals on one machine or another for several years past. All who have owned the guilty machine know about them; we journalists know about them. We cannot tell the public because of the libel laws, and the disgusted purchasers can only tell a small circle of acquaintances. If these defects were specified and named, the public would bless the men who told them. However, the number of these faulty details is being annually reduced, and perhaps by the time the A.C.U. sees its way to be absolutely outspoken, none of them will survive.

The motor cyclist's outfit is pretty well covered in the report, together with threatenings of extra stringencies for 1910—not a day too soon, either. I hope the General Committee will see their way to adopt stricter time rules, as foreshadowed, for next year.

A Most Important Omission.

There is only one serious omission in the report, and that relates to comfort, which is only mentioned in connection with big tyres. Spring frames were chiefly conspicuous by their absence, and the most successful machines were not always comfortable. The spring fork on one make was either screwed up till devoid of spring, or else required frequent lubrication. That on another make caused the rider's hands to "dither" perceptibly and violently all day long, and clashed frightfully over bumpy roads. Two makes of spring fork competing were so obviously and immensely superior to all the other brands that they certainly deserved special commendation. As the judges estimate that comfort is one of four conditions needed to ensure a vast increase in the popularity of motor

Judges' Report on the Six Days' Trial.—

...ing, this omission is rather surprising. Every experienced motor cyclist will endorse their remarks upon the need of easy starting and the ability to climb steep hills under *all* conditions, both of which imply a variable gear. As a matter of fact, the easy starting was universal this year, and the hill-climbing notoriously bad. I think the fact that not a single machine proved chronically difficult to start might have been mentioned, as one of the great advances upon 1908; and also the fact that what successful hill-climbing was witnessed was usually obtained by playing about with the carburettors, cooling down the engines, and either changing belts or adjusting pulleys. Few machines tackled the test hills on the run without reparation.

In conclusion, if I may arrogate without any mandate the position of spokesman for the amateur

motor cyclists of the country, we are all jolly grateful to the A.C.U. judges. They must often find their task a thankless one, as they come into closer contact with those they seem to oppress than with those they benefit; and we whom they benefit so enormously are unkind enough to offer many criticisms, just because their task is so important, and because we owe them so much, that we want to owe them even more. We ought to hold an annual dinner, at which we could give them all a very hearty vote of thanks for their most arduous and completely honorary labours, and for the efficiency with which those labours are performed. But as we do not get that opportunity, I have the pleasure to propose on paper a very hearty vote of thanks to them all, coupled especially with the name of A. G. Reynolds, who, I am gratified to hear, is practically recovered from the nasty accident he met with when watching over our interests.

ANOTHER END-TO-END SIDECAR RECORD.

FOR less than a month the Land's End to John-o'-Groat's sidecar record, established by Vivian Olsson on a 7 h.p. V.S. and Millford sidecar, has been allowed to stand. Arthur W. Bentley, who held the motor bicycle End-to-end record for nearly twelve months, is the new claimant to the title of record holder, he having clipped 6h. 7m. off V. Olsson's time. A. W. Bentley started with his brother Horace as passenger on Monday evening of last week at 7.50 from John-o'-Groat's, reaching Land's End at 6.57 on the Thursday morning, the total time occupied being 59h. 7m., as compared with the original record of 65h. 14m., which has stood since August 7th last. J. Robertson, of Wick, held the watch at the starting point, J. Taylor, of Penzance, being the timekeeper at the English end. As is usual in present day record attempts, the vital parts of the machine were sealed before the start, *The Motor Cycle* being invited to perform this ceremony. Bentley's mount was a 5 h.p. twin-cylinder two-speed 1909 Rex, with Millford sidecar. Some details of the machine will be of interest. The ignition was Bosch magneto, the tyres Shamrock Excelsior, belt Shamrock-Gloria, saddle Lycett, carburetter Brown and Barlow, while the illumination at night was entrusted to a pair of Lucas lamps. The weather was by no means favourable, but suitably clad in oilskins and sou'-westers, the record breakers manfully battled the elements. The wet weather was the cause of belt troubles, and naturally rendered the ride much more arduous, particularly with a sidecar and passenger.

The following telegrams sent to the Rex Co. and submitted to us will serve to show the progress made by the brothers Bentley:

WICK. 9.1 p.m., Aug. 30th.—Bentleys left Groat's at 7.50 p.m.—(Signed) Robertson.

INVERNESS. 10.30 a.m., Aug. 31st.—Bentleys left here 4.45 a.m.—(Signed) Palace Hotel.

PERTH. 11.38 a.m., Aug. 31st.—Bentleys left 11.30. Rain all way.. Belt troubles.—(Signed) Lindsay and Fenwick.

LOCKERBIE. 5.50 p.m., Aug. 31st.—Bentley left 5.45 all right. Chinn met him.—(Signed) King's Arms.

WARRINGTON. 8.37 a.m., Sept. 1st.—Bentley, Moorhouse, and Chinn left Warrington 3 a.m., going well.—(Signed) Francis.

TEWKESBURY. 1.41 p.m., Sept. 1st.—Bentley left 1.30 p.m. Machine going well.—(Signed) Charles.

BRIDGWATER. 6 p.m., Sept. 1st.—Bentleys passed through six o'clock, going well.—(Signed) Moorhouse.

Arthur W. Bentley (on right) and his brother Horace ready to start from John-o'-Groat's Hotel in an attempt—which proved successful—to beat the End-to-end sidecar record. The bicycle will be recognised as a 5 h.p. twin-cylinder two speed Rex

WELLINGTON (Somerset), 7 p.m., Sept. 1st.—Bentleys left Wellington 6.45, going well.—(Signed) Stone.
 TAUNTON, 8.10 p.m., Sept. 1st.—Left Taunton 6.25 and Wellington 6.45, going well.—(Signed) Stone.
 EXETER, 9.14 p.m., Sept. 1st.—Bentley left at 9 p.m.—(Signed) Lord.
 EXETER, 9.39 p.m., Sept. 1st.—Bentley left nine to-night, going well.—(Signed) Moorhouse.
 PENZANCE, 9.50 a.m., Sept. 2nd.—Bentleys arrived Land's

End 6.57 to-day.—(Signed) Taylor.

As these pages went to press Bentley had not returned from Land's End with his machine, so as yet we have been unable to examine the seals we placed on the machine. We have no doubt, however, that they will be intact. If Mr. Bentley arrives back in time, some further reference to the ride may appear on our centre pages.

OCCASIONAL COMMENTS.

By "IXION."

Colonial Models.

I was considerably surprised last week when inspecting a batch of British-made motor cycles on the eve of being shipped out to one of our colonies to notice two grave defects about them from the colonial rider's point of view. They had vital parts of the mechanism within about 4in. of the ground. I should have thought that by now the veriest novice maker knew that in most of our colonies big boulders and large stones are pretty freely strewn about the roads, and that such things as magneto brackets and engine crank cases ought not to be placed where a big stone is sure to hit them. The other point may be more debatable, though I do not think so. They all had rubber belts. Three facts militate against the efficiency of rubber belts in the colonies. The extreme heat causes them to perish before they are worn out.

Water splashes are by no means uncommon in almost every colony, and in some the machine has frequently to be pushed through a "drift"; in both cases a rubber belt will not grip until it has been dried. Lastly, roads are less carefully graded than here, steep ascents are frequent, and small engine pulleys are essential. A rubber belt will stand a small pulley for a brief period, *e.g.*, temporarily in an A.C.U. trial to climb Dinas or Festiniog. But let any reader try to run a fairly wide rubber belt on a small engine pulley continuously, and he will soon discover that, owing to its failure in flexibility, as compared with a built up leather belt, it has to be run very tight, or it will be perpetually slipping; and as soon as a rubber belt is run continuously in an extremely tight condition, the pulling through trouble commences. In addition, rubber belts will break up sooner on small diameter pulleys. I deal with these points, in the hopes that makers will tumble to the situation and save future purchasers some of the aggravation experienced by those who have been through the mill. Rubber belts are magnificent for home use, but if we had to use very low gears in a tropical climate the rubber belt makers would soon find their occupation gone.

The Private Owner of Many Machines.

I long ago abandoned as hopeless the task of distinguishing the genuine private owner. There is no absolutely certain mode of procedure which can enable any official or club to weed out the shamateur from

the private owners' classes. But the impossibility of drawing an absolutely hard and fast line need not deter us from approximate segregation. And in this connection I should like to confess I am rather puzzled by two or three instances. I see men riding as private owners who bring out a different machine every week—in some cases even a different make of machine every week. I see others figuring as private owners whom I know perfectly well to be engaged in the motor trade, and not unconnected with the interests of the machine which they bestride in competition as private owners. I even remember one instance of a rider's photograph appearing in a motor journal as the winner of a private owner's special prize when he was interested to the extent of about £2,000 in the machine he was depicted with, and that not as a shareholder, but as a principal!

Whittington-in-Lonsdale, North Lanes., is a village of 150 souls, and boasts five motor cyclists. From left to right they are J. Watson (3½ h.p. Excelsior), F. Middleton (3½ h.p. Triumph), J. Jenison (2½ h.p. Minerva), T. Jenison (3 h.p. Triumph), and Rev. J. Hodgkin (4 h.p. N.S.U.)

I think some of our clubs want waking up in this respect. The amateur rider is taking a very enthusiastic interest in the sporting side of the hobby just now, and the cleaner we can keep the sport, the better it will be for the trade themselves in the long run. A big win by a doctor, a lawyer, a parson, or other obviously amateur owner, does a firm more good than twenty wins with a mechanic up. I think it would be rather a sound plan if a table of the professions followed by the successful riders in the next 1,000 Miles Trial were published. I recommend the idea to our friends of the A.C.U., who, of course, are quite as interested as I am—if not more so—in keeping the pastime as pure as possible.

QUESTIONS

AND REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor St., E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Noisy Valve Tappets.

? Would you kindly inform me how I can stop the click of my valve tappets? My machine is a $3\frac{1}{2}$ h.p., 1907 pattern. It runs splendidly. When I wheel my machine along the tappets drop with a loud clack, which is very annoying. The tappets lift direct off their respective cams. If you could suggest a remedy I should be much obliged.—R.D.S., Puckeridge.

The noise is caused either by the tappets striking the bottom of the

SOME ENTRANTS FOR THE TOURIST TROPHY.

J. F. Jones (Pwllheli), $3\frac{1}{2}$ h.p. T.T. Triumph, Bosch magneto, Dunlop tyres.

valve stems, or the valves falling suddenly upon their seatings. The amount of noise depends on the shape of the cams. You can reduce the noise by brazing or fitting a cap on the tappets, thus reducing the distance between tappet and valve. If, however, the trouble is due to the shape of the cams there is little or no cure. One way to reduce noise is to fit fibre discs to the top of the tappets. Rather a difficult job in the case of a motor cycle, and the fibre would, we are afraid, soon wear. Light springs under the tappets holding them gently up to the valve stems will reduce the noise to some extent, but great care is necessary to get the right strength of spring, or it will interfere with the rapid and perfect closing of the valves, a most important point in the case of high speed engines.

Continental Touring.

? I propose at the end of this month to go with a friend touring in the South of France on motor bicycles. I understand that there are a number of formalities to be gone through prior to the introduction of a motor bicycle into France. Perhaps you would be kind enough to tell me if there is any means whereby one can avoid passing the driving test on arriving in France.—COSMOPOLITAN, Gloucester.

The best way to get over the difficulty is to become a member of the Auto Cycle Union or Motor Union, which will allow you to have access to the well-organised touring departments of these organisations. You will then be able to take your machine into France without paying any deposit, and have your licences procured for you and most of the formalities gone through before you leave England. (See page 663.)

Change Speed Gear Slipping.

? I have been having trouble with the gear of my P. and M. through the oil getting on the rings. Last month I pumped some thick graphite grease into the recesses of the rings. Since then it has been slipping very badly, although I have taken the gear to pieces and cleaned out the grease and put some Price's thick yellow in, but after the first mile it was just as bad as ever. The gear does not appear to be worn at all, but the wedge bars do not expand the rings to their fullest. Can you suggest a remedy? Do you think filling the recess of rings fully with grease would be the cause of grease getting on the rings, or should the rings be only half filled? Would you recommend Fuller's earth being put on the rings?—OK 15.

First of all, note the range of your change-speed lever. If this is excessive it seems to point that the wedge bars are hardly thick enough, and do not expand the rings properly. If, however, the range is short, this is not the case, and if you again wash out the expanding rings and their surrounding races with petrol thoroughly and put in fresh grease, we do not think you will find the trouble recur. Fuller's earth is not necessary. When changing speed raise the exhaust valve lifter till the engine has quite slowed down and then engage. This should also help to cure the trouble.

Belt Turning Over and Loss of Power.

? Can you explain the cause of a rubber belt turning over in the belt rim? I have reversed it and cleaned it and had the engine pulley trued. I have a one year old $3\frac{1}{2}$ h.p. Fafnir engine, accumulator ignition, governed on the inlet valve. When new, it used to climb anything on half throttle, but always overheated considerably. This I attributed to a 6in. wide mudguard to front wheel, which I had fitted to enable me to keep

W. O. Bentley (Hampstead), $3\frac{1}{2}$ h.p. Rex Speed King, Bosch magneto, Brown and Barlow carburetter, Dunlop tyres.

myself clean. I use machine for business purposes. Now it will not do more than twenty miles an hour on full throttle, and fails on every hill. Engine has a B. and B. carburetter. I have fitted new exhaust valve spring and opened holes in the silencer. Engine is clean, and there is no carbon on piston. Compression is perfect. I use Vacuum oil, and have always done so. Have tried everything in "Hints and Tips," and have asked a number of riders. Can you tell me how to make a gauge to try the pulley groove, to see that it is kept at the correct angle? Shall be glad of your help.—B. S. WRAGG, Battle.

The pulleys are either out of line or groove in rear pulley is too vertical on side nearest spokes; also when the engine pulley was trued the groove may have been altered in angle or made too

3½-4 h.p. Single-cylinder, £47 10s.

THE BAT

is fitted with **SPRING FRAME AND SPRING FORKS**, in which ball-bearings are utilised to minimise friction, and the contrivance is so efficient as to enable riders to undertake long journeys without that tired feeling (caused by excessive vibration present in most motor cycles). It is fitted with **AUTOMATIC LUBRICATION**, which is entirely self-feeding and perfect in action, allowing no excess or deficiency of oil, but a continual and perfect feed at all engine speeds. J.A.P. engines are fitted to all models, which are the most perfect engines made. **BOSCH MAGNETOS** are fitted and driven by bevel-gear shaft, mounted on ball-bearings. The magneto is fitted above the engine in the tank, and entirely protected from all wet and dirt, and every other component part is specially selected for its particular function, and the whole has been aptly termed "**THE PULLMAN CAR OF MOTOR CYCLING**." It must not be taken that, as the **BAT** has beaten all single-cylinder records (**59½ MILES IN THE HOUR**), it is purely a racing machine. This would be erroneous, and has been disproved in the **1,000 miles RELIABILITY TRIALS**, from which it emerged gaining **THREE GOLD MEDALS AND SILVER CUP**. In these trials its tremendous reserve of power was exhibited on all the hills, and freely commented upon in the press. **FASTEST TIME OF THE DAY** was made by the **BAT** at the **SUTTON BANK, ASTON, AND BRADFORD OPEN HILL CLIMBS**, and yet the **BAT** can be driven slowly through the densest traffic, or round the trickiest corner with ease.

The
**Indian's irresistible
rides to victory**

accomplished by
the aid of

BOSCH MAGNETOS.

Hendee Manufacturing Company,
12, Fieldsway House,
Highbury Crescent, N.

Dear Sirs,

August 13th, 1909.

It may interest you to know that the "Indian" motor cycles, which have been so successful in speed and reliability trials this season, are fitted exclusively with the Bosch magneto ignition, and I think have very effectually proved that the magneto is in every way more suitable for high speed as well as reliability than the old type of coil and accumulator ignition.

What I consider a most marvellous feature about your D.A.V. type machine is that there is absolutely no misfiring or irregularity in the running of the engine when they are speeded up to over 5,000 r. per m. in the testing room.

It was suggested to me last spring when in America that I might find for track racing the coil and accumulator to be faster, but I am pleased to state that these same machines fitted with the Bosch magneto have made faster times in this country than they have ever made in open competition in America fitted with coil and accumulator.

Yours truly,
(Signed) W. H. WELLS.

In answering these advertisements it is desirable to mention "The Motor Cycle."

At the Journey's end

there is no item of Touring Equipment which will be more keenly appreciated than the

BROOKS CARRIER BAG.

This has been designed for general all-round service—it is made of the finest waterproof canvas on special fibre board—is roomy, strong and light, and fitted with a special dust-excluding arrangement.

A unique feature is the removable inside case which, "at the journey's end," can be lifted from its outer covering with the absolute certainty that both the Bag and its contents, are perfectly clean and dustless.

It is attached to the Carrier by means of adjustable and detachable clips and, to the rider who studies comfort and convenience, it will prove of the greatest value.

Write us now for particulars. Dept. B45.

**J. B. BROOKS & Co., Ltd.,
BIRMINGHAM.**

BROOKS

Motor Cycle Carrier Bag
with removable inside case.

27/6

Supposing

the Saddle is not a Brooks, it cannot yield that perfect comfort which is essential to the success and enjoyment of your Tour, because it cannot embody those exclusive features which make perfect comfort possible. Take one only—the

BROOKS PATENT COMPOUND SPRINGS

as fitted to every model of the

BROOKS ANTI-VIBRATORY SADDLES & SEATS

These absorb vibration as none other can, and totally eradicate all tendency to bounce—That means a saddle of perfect ease—a seat of perfect luxury, and—Remember, that is only one of the merits which make for its superiority—

There are many others, and you should learn more of them by a study of our Saddle Manual, which we will send you free.—Dept. B45.

low. Each or all would account for belt turning over. Better verify obtain new engine pulley and belt. It is difficult to account for the ng off in power and overheating of engine, unless valve gear is worn valves do not lift sufficiently, particularly exhaust valve. Any of the known belt makers will supply you a tin gauge to test the correct le of the groove in the pulleys. Try ett's or O. and W. Ormerod, Ltd.

Engine Braking.

As a novice in motor cycling and a new subscriber to your paper, I should be obliged if you would give me information on the following: In a recent issue of *The Motor Cycle* you informed an enquirer that if he closed the throttle and cut off the supply of gas to the engine, the engine would act as a brake in descending hills. Could you explain to me how the engine thus acts as a brake; also will not this cutting off the supply of gas stop the engine and necessitate a restart at the bottom of the hill?—W.E., Abbeystown.

The engine acts as a brake when the throttle is shut, because it ceases to propel the machine, its compression and internal friction retarding the progress of the machine. Before reaching the bottom of the hill the current is switched on or throttle gently opened, and, of course, if everything is in order the engine commences to fire again and propel the machine.

Winner in 1907, C. R. Collier (Plumstead), 5 h.p. twin cylinder Matchless-J.A.P., a.c.i.v., Bosch magneto, Longuemare carburetter, Dunlop tyres.

Misfiring due to Contact Points or Coil.

My mount is a $3\frac{1}{2}$ h.p. N.S.U., with accumulator ignition and plain coil, and have not been troubled before with misfiring, to which it has lately taken a fit. I have tried everything, and find after cleaning the tips of make and break that it runs well for about ten or fifteen miles, then starts misfiring badly, which I think is due to a deposit of something like solder on the ends of platinum tips, not black or pitted. I have tried adjusting them to touch as lightly as possible, but the engine will not fire at all unless they touch heavily. I have filed tips before, so do not think they were only capped with platinum.—F.E.E.

It seems most likely that the points require new tips of genuine platinum or iridium, but the trouble may be due to the failure of the condenser in your coil. We should advise you to lay the trouble before the N.S.U. Co. Try another coil on the machine; it will soon tell you if the last mentioned trouble we have suggested is the fault.

A Machine for Sidecar Work.

I am in doubt as to whether to purchase a single two-speeded machine or a twin two-speeded machine. I am a good amateur mechanic, and can manage a single-cylinder machine easily. Do you, or do you not, consider that the extra complication and weight of a twin would be more than counter-balanced by the additional smoothness of running and consequent extra comfort of a twin? I ask this because writers appear to think that the modern single is jerky. My present mount is a 1906 $3\frac{1}{2}$ h.p. single-cylinder Quadrant. I want comfort and sufficient power for all hills with a two-speed gear when used as a solo. Do you think a single with two-speed gear would be powerful enough to take a sidecar over hilly country at a reasonable speed?—C.W.

As you intend using a sidecar we have no hesitation in recommending a twin. Of course, a single-cylinder would do very well, but you want the maximum amount of power possible for a passenger machine in a hilly country. We do not think you will find the modern twin to be too complicated for you.

Speedometers, Clutches, etc.

I should be much obliged if you would give me your valuable advice on the following: I have just bought a 3 h.p. Triumph, second-hand. (1.) Do you recommend the use of a speedometer? (2.) Is a clutch a great advantage for other purposes than traffic driving? (3.) Can you recommend Motor Union for motor cyclists? (4.) How often ought oil to be pumped into the crankcase? (5.) Do you recommend a spring seat-pillar?—E. DEWAR, Perth.

(1.) Yes, a speedometer is most useful in these days of police traps and persecution. (2.) A clutch is of great advantage for starting and in traffic, but a variable speed gear is more use-

H. V. Colver (Plumstead), $3\frac{1}{2}$ h.p. Matchless-J.A.P., m.o.i.v., accumulator and coil ignition, Longuemare carburetter, Dunlop tyres.

ful. (3.) The institution mentioned is quite satisfactory, and has a section devoted to motor cyclists. (4.) We should oil the machine mentioned in your letter to the extent of about one pumpful every fifteen miles. (5.) A spring seat-pillar is highly recommended provided it does not increase the height of the rider's saddle.

Belt Fasteners Pulling Through.

I have been using 3in. rubber belts, and I have been troubled by fasteners pulling through. I have not had much experience of leather belts. Could you tell me if they would be likely to give less trouble? I am not a speed merchant, but want all-round service and reliability. I should not mind the scraping and oiling processes, which, I understand, leather belts require. I suppose also leather is harder on the pulleys. Taking everything into consideration, should I get better wear and freedom from breakage with a leather belt?—H 3266.

You will find that a first-class leather belt will last longer than a rubber belt, but it entails more trouble to keep in order. It must be periodically scraped free of grit, and then dressed with Collan or some suitable oil. A leather belt is hard on the pulleys if it is allowed to get gritty. Certainly, you should have freedom from breakage with one.

S. C. Perryman (Birmingham), 5 h.p. Twin Norton, m.o.i.v., 75×84.5 mm., Bosch magneto, E. and B. carburetter.

SPECIAL FEATURES

"THE AUTOCAR LEAGUE."
THE JUDGES' REPORT ON THE SIX
DAYS' TRIALS.
THE T.T. RACE WEEK.

Sep. 8..7.31 p.m.

,, 11..7.24 ,,

,, 15..7.15 ,,

Six Months Index to "The Motor Cycle."

A very complete index to *The Motor Cycle* from January to June is now ready, price 3d. Subscribers will find a copy inserted with each issue.

A Good Warning.

A good warning of the furlong 15 m.p.h. at Bromley, Kent, the other day, was provided by the word "trap" written in white tyre paint across the tarred road at the top of Bromley Hill. It was so effective that the police relinquished timing.

Inland Revenue Licences.

We may remind new readers of *The Motor Cycle* that motor vehicles on which Inland Revenue licences are taken out during the last three months of any year are only subject to half the usual licence fee, so that, from October 1st till December 31st the Inland Revenue licence for motor cycles will cost 7s. 6d.

The Autocar League.

The attention of readers is called to this week's supplement referring to "The Autocar League." We urge all motor cyclists to sign the slip at the foot of the form and return to us, as by so doing the league will be able to safeguard the interests of motor cyclists in addition to those of autocarists. The subject is also referred to in the leading article this week.

Isle of Man Regulations.

All owners of cars and motor cycles on arrival in the Isle of Man are supposed to register their machines at the offices of the I.O.M. Highway Board, Athol Street, Douglas, within twenty-four hours of landing. There is no charge, as motors can be used in the island for thirty days without paying the local taxes. Many visitors are apparently unaware of this regulation.

Motor Cycles on Bridle Paths.

A correspondent to *The Autocar*, writing under the nom-de-plume of "D. D.," enquires whether a motor bicycle can be legally driven along a bridle-path. This is a query we cannot remember having seen before, and we think it will probably interest other readers to know that if it has been customary to use the road or path for bridle purposes only, the owners of the property (if the road is a private one) should be able to obtain an injunction to restrain motor cyclists from using such road. However, if the motor cyclist can show that the road has been used at any time by pedal bicycles, carriages, or for any other purposes, it would be difficult to prevent motor cyclists from travelling along it.

Indians for the British Market.

Encouraged by the success of Indian motor cycles in English competitions, the Hendee Manufacturing Co. has leased premises at 184, Great Portland Street, W., which will be opened on the 1st prox. Mr. W. H. Wells is to take charge of the branch. Great Portland Street is becoming the Holborn Viaduct of the motor cycle industry, for already the F.N., N.S.U., and V.S. motor cycle manufacturers have depots in that quarter.

Bristol E. & M.C.

On Saturday next a reliability trial will be held over a circular route of about twenty miles, to be covered three times. Start from the Bank at Filton tram terminus, *via* Filton railway arch, Hambrook, Winterbourne, Iron Acton (turn left), to Rudgway, on to main Gloucester Road, and back to starting point. Three prizes will be awarded.

A Motor Cyclist and Aviator.

It is not generally known that G. H. Curtiss, the American aviator who won two prizes at the Rheims flying week, is the head of the motor cycle manufacturing company bearing his name. Curtiss was the motor cyclist who, at Ormonde, Daytona, about three years ago, was declared to have ridden a mile at a speed of over 120 miles an hour. His monstrous mount had eight cylinders, and was rated at 40 h.p. Curtiss's first flying machines were propelled by motor cycle engines.

Henryk Weiss (5 h.p. Twin-Rex), winner of the Warszawa-Lublin-Warszawa race, the motor cycle championship of Warsaw. The distance was about 178 miles, covered by the winner in 5h. 2m. 43s. A Rex rider was second in 5h. 3m. 20s.

The Large Entry for the T.T.

Surely no one could have expected such a large entry for the 1909 Tourist Trophy, and it once again proves the ever-increasing popularity of motor cycling. The large amount received in fees, viz., £283 10s., will go a long way towards defraying the expenses of organising the race. The make of machine most represented is the Rex with seventeen riders, next the Triumph with twelve riders.

Erratum.

The paragraph on page 660 last week anent W. H. Bashall really referred to his performance at Brooklands in the hour race on the 18th ult. We pointed out in the report of the event that Bashall only covered 43 miles 1,300 yards in the hour, which is twelve miles less than he has travelled in the same time on the same machine, not knowing when this statement was made that a broken petrol pipe caused some delay in the last ride.

The T.T.

What an interesting and exciting race the Tourist Trophy promises to be! With fifty-six competitors mounted on the pick of the motor cycles of England, France, Belgium, Germany, and America, the event is truly an international one, and the race will be worth travelling a long way to witness. Single-cylinder and twin-cylinder machines are fairly evenly divided, and there is still much speculation as to whether a single of 500 c.c. will prove faster than a twin of 750 c.c. One prominent manufacturer's opinion is that another win on a single cylinder is too much to hope for. Still, there have been many surprises in the past.

The Hill Climbing Competition in the Isle of Man

Last week it was mentioned that four classes would be formulated for the above competition, but it has now been decided to add a further class, making five in all. We are sorry for some reasons that the A.C.U. has chosen a perfectly straight hill for the above most important trial in the Isle of Man. As a pure test of speed uphill a straight course is undoubtedly correct and the safest for the competitors, but a hill with two or three hairpin bends is the best test of the flexibility of a touring machine. This is just where the average single-gear motor bicycle is behind its *confrère*, the variable geared car. To get up steep winding hills it has to be rushed instead of ridden at a comfortable speed that is suitable to the corners and gradients.

A WORD ABOUT MOTOR CYCLE HEADLIGHTS.

Why not do away with that oil or acetylene lamp and have electricity. You will find it ever so much more cleanly, and it requires practically no attention. The illustration shows our Model C. Headlight. When not in use this lamp is easily detachable. It gives a powerful and really ample driving light.

SIZE: Glass, 4in. ; Bell, 5in.
PRICE, 18/6. Nickel or Brass.

Model "C."

Our illustrated Catalogue, containing particulars of our various Electrical Specialities for Motor Cyclists, will be sent post free on receipt of a postcard.

THE NEW C.A.V. MOTOR CYCLE MAGNETO,

capable of giving an intense spark at very low speeds, is Light, Neat, and Efficient.

12 Months' Guarantee with each Machine. Made in three distinct types—for Single Cyl. Engines, £4 10s. ; Twin Cyl. do., £5, Twin Cyl. V Type, do., £5 10s.

Real Hill Climb.

Since writing the preceding paragraph, we are advised by the A.C.U. that a second hill-climb is to be held on Snaefell on the afternoon of the 24th inst., the one at Kewagigue being fixed to start at 10 a.m. What a real test of hill-climbing the long climb up Snaefell will prove. Engines which have a tendency to overheat quickly or knock badly at slow speeds will probably find this climb too much for them. The hairpin bend at Ramsey has been included.

Mont Ventoux Hill-climb.

This once famous French climb only secured a small entry this year, chiefly owing to an understanding among the majority of manufacturers not to compete in races and hill-climbing competitions. On Saturday a French motor cycle named the Excelsior secured the premier award in both classes. In Class I. it climbed the 13½ miles of the ascent in 42m. 8s., and in Class II. in 1h. 9m.

B. Vickers-Jones (Coventry), 3½ h.p. Twin Premier, m.o.i.v., 66×80 mm, B and B. carburetter, Bosch magneto, Dunlop tyres.

24½s. The record for the climb is held by a Brasier car—19m. 8s. The gradients vary from 1 in 11 to 1 in 7½.

FUTURE EVENTS.

- Sept. 11—Open Hill-climb at Barnsley for the Littlewood Challenge Trophy.
„ 12—Semmering Hill-climb (Austria).
„ 23—THE TOURIST TROPHY RACE FOR MOTOR CYCLES IN THE ISLE OF MAN.
„ 24—Hill-climb on Kewagigue Hill, Isle of Man. Five classes. Start 10 a.m.
„ 24—Hill-climb up Snaefell. Start 2.30 p.m.
Oct. 6—Race meeting at Brooklands (two events for motor cycles).
„ 9—Two Hours' Record Race at Brooklands, organised by the British M.C.R.C.
„ 16—A.C.U. Fourth Quarterly Trial of 1909, Uxbridge to Banbury and back.

Barnsley Hill-climb Postponed.

The open hill-climb for the Littlewood Trophy (holder, J. Marshall) has been postponed until the 30th inst., owing to unforeseen circumstances. The conditions and entry forms will be circulated this week.

The Next M.C.C. Event.

The next important event to be held (in about a month's time) by the M.C.C. will be a gymkhana, for which purpose Mr. Arthur Du Cros has kindly offered the use of his park near Edgware.

Tourist Trophy Race.

The Ulster Centre M.C.U.I. has decided to offer a gold medal for the first Irish rider to be placed in the T.T. Race. In addition to the names already published from Ireland an entry has been received from Mr. F. H. Maclean, Belfast.

Cylinder Capacity.

Owing to an unfortunate error, the size of Mr. Bowen's Bat-J.A.P., which made such a splendid performance at the last members' meeting of the B.M.C.R.C. at Brooklands, was given as "84.5×89 mm.," whereas a standard engine was used, the bore and stroke of which are 85×85 mm. The engine was a standard 3½ h.p., with side by side mechanically operated valves.

Southampton's Antagonism to Motor Vehicles.

The Southampton Bench last week fined their own fire brigade captain for driving the town's motor fire engine at thirty miles an hour. The captain urged that it was necessary for him to practise driving at this speed. It would be rather provoking to the magistrates if, supposing one of their residences caught fire, the fire brigade captain refused to do more than crawl to the scene of the conflagration. Driving to the common danger does not apply to horsed engines.

H. Lister Cooper (Southampton), 3½ h.p. T.T. Triumph, Bosch magneto, Dunlop tyres.

The International Auto Cycle Tourist Trophy Race.

LATEST DETAILS. SOME AMENDMENTS TO THE RULES. THE AWARDS SETTLED. A HILL-CLIMBING CONTEST ON SNAEFELL ARRANGED.

The rules and regulations have now been finally settled. The following are the latest amendments to the rules and the most recent news about the race in general. The competitors will be started from St. John's at 10 a.m. at half-minute intervals. Any shape of handle-bar will be permitted. The machines will be weighed (for statistical purposes only) and examined by the officials at the enclosure, St. John's, from 10 a.m. on Wednesday, the 22nd inst. Immediately after these operations have been concluded, the brakes and silencers will be tested. The competing machines will not be allowed to carry trade numbers. Practising over the course will only be allowed on week days up to 10 a.m. It is not desired absolutely to prevent riders from using their machines at other times, but the A.C.U. wishes it to be known that driving at excessive speed or to the annoyance or discomfort of the public will disqualify a competitor from taking part in the race and render him liable to suspension from future competitions. To enable those taking part in the race

to hear clearly other competitors who are trying to pass them, the participants will be required to wear ear guards.

The Numerous Awards.

In addition to the splendid trophy presented by the Marquis de Mouzilly St. Mars there will be a silver cup (value £5 5s.) awarded to the first private owner to finish, a silver cup (value £2 2s.) to the second private owner to finish, prizes of £40, £20, £10, and £5 in cash, Mr. Brooker's prize for the competitor who runs the most consistently, and silver medals to those riders who complete the course within the time limit and who are not eligible for the above awards. Tyre stations, where petrol, oil, water, etc., may be obtained, will be established at Kirk Michael and St. John's. Messrs. R. Todd, J. W. G. Brooker, A. Sharp, H. G. Cove, and V. Hart have been invited to act as judges, and Messrs. A. G. Reynolds and A. V. Ebbelwhite and P. C. Glazebrook will act as timekeepers. A.C.U. headquarters at Douglas, Hotel Sefton.

Two Hill Climbing Competitions.

On the day following the race (Friday, 24th inst.), there will be two hill-climbs. The Kewagigue and Richmond hill events will begin at 10 a.m., after which the competitors will proceed to Ramsey, where lunch will be served, when at 2.30 p.m. a hill climb will take place from that town round the famous hairpin bend and up the mountain road to the Bungalow at the foot of Snaefell—a course about six miles in extent. The awards will be made on the performances on both hill-climbs. The classes will be the same in each case, but in each class there will be a sub-division for private owners. A gold, silver, and bronze medal will be awarded in each class provided ten entries are received, and the entry fee will be 10s. 6d. From the above it will be seen that the Isle of Man Week will be full of attractions, and, provided the weather is fine, a most interesting time is expected. Shorn of its petrol limit the race should be most exciting, while the hill-climbs should provide really good sport.

THE TOURIST TROPHY RACE FUND.

The donations to the above fund have now reached the sum of £59 8s., made up as follows:

Amounts previously acknowledged in *The*

<i>Motor Cycle</i>	£14	19	6
JEBRON	1	0	0
P. S. White	2	0	0

Owing to the additional expense incurred this year in organising and holding the race, the Auto Cycle Union will gratefully acknowledge any donations, however small, towards the fund. Collecting sheets can be obtained from the Secretary, 18, Down Street, Piccadilly, W., or *The Motor*

Cycle Offices, 20, Tudor Street, E.C., and Coventry. As already announced, *The Motor Cycle* is contributing 1s. for

York County M.C.C. speed trial in the grounds of Temple Newsam. Scene at the start. The winner, C. S. Allan (1909 Triumph), is in the foreground.

every £1 up to £100 sent in by club secretaries or others. Cheques, postal orders, etc., should be made payable to the Auto Cycle Union, and may be addressed to the club or the Editor of this journal as above. All contributions will be acknowledged in these columns.

MURATTI TROPHY RELIABILITY TRIALS.

THE annual open competition for the Muratti Trophy, under the auspices of the Ulster Centre of the Motor Cycle Union of Ireland, took place on the 30th and 31st ult. The first day's ride was from Belfast to Ballycastle, going by the coast and returning inland. This course was traversed twice, the total distance for the day being 236 miles. Checking stations were arranged at Larne, Ballycastle, Ballymena, and Belfast, and 10 marks were allowed for each of these. At the end of the first day, J. Stewart (3½ h.p. Triumph), C. E. Murphy (3½ h.p. Triumph), and O. C. Godfrey (3½ h.p. Rex) claimed to have secured the maximum number, the other competitors who lost marks being J. Coulter (3½ h.p. Triumph), T. Greer (5 h.p. Rex), B. J. McManus (3½ h.p. Triumph), W. J. Andrews (3½ h.p. Rex), and F. Jones (3½ h.p. Minerva). On the night of the 30th the machines were in control in the Ulster Motor Works, through the courtesy of Mr. Stanley Corry.

Second Day's Ride.

The route arranged for the second day was from Belfast to Dublin and back, a distance of 208 miles. The checking stations were at Banbridge, Dundalk, Drogheda, and Dublin. McManus, Greer, and Jones did not start for the second half of the ride, having had some trouble the previous day. The finish was at the Show Grounds, Balmoral, and prompt to time Stewart, Murphy, and Godfrey arrived, each claiming to have secured full marks. The committee met afterwards to go into the check books, and it was reported that at one of the controls a mistake had been made in the times recorded. It was considered advisable, therefore, to investigate the matter before proceeding to place the riders, and a further meeting was called for the 2nd inst. Correspondence was read regarding the difference in the times, and after consideration it was decided to endeavour

to have the timekeeper present at next meeting, which was provisionally arranged for September 7th. We hope to announce the awards in our next issue.

So far as the competition itself was concerned, it proved most enjoyable, the weather being good and the roads in perfect order; and, notwithstanding the smallness of the

Muratti Trophy Trials, 444 miles. The start from Dublin on the last stage of the second day's run. From left to right—W. J. Andrews (3½ h.p. Rex), O. C. Godfrey (3½ h.p. Rex), J. Stewart (3½ h.p. Triumph), and C. E. Murphy (3½ h.p. Triumph). The three last mentioned gained full marks, and it so happens that all are entrants for the Tourist Trophy.

entry, the greatest interest was taken in the contest, the finish on each day being witnessed by a large crowd of interested spectators. So far as we can learn, the committee are experiencing trouble in separating Stewart and Murphy, and it will be recollected that these two riders were equal in points last year in the same contest, and although an extra two hundred miles were ridden, no change took place, and they were ultimately declared joint holders.

THE M.C.C. CONSUMPTION TRIAL.

AS regards weather, the Motor Cycling Club was particularly unfortunate on Saturday last on the occasion of its annual consumption trial. Last year the event was held on a rainy afternoon over a circular course about five miles in extent in the neighbourhood of Gerrard's Cross, and this year the elements were still more unkind, as rain fell almost continuously the whole time. The competitors were weighed at the Bull Hotel, and when at last the rain eased off a trifle the men were sent round the course. Leaving the inn the second turning on the right was taken, a dangerous S bend on rather a steep hill descending into Fulmer was negotiated, followed by a short stiff ascent out of the village, and then the road became more or less level. Bearing always to the right another descent followed by a steep climb was encountered, then more level, and the main road was reached. Shell motor spirit was doled out to the riders at the rate of one pint for 300 lbs. total weight, increasing to $1\frac{1}{2}$ pints for 600 lbs. and to $2\frac{1}{4}$ pints for 1,200 lbs. in the passenger class, irrespective of the size or type of the engine, due allowance being made for all intermediate weights.

The multi-cylinder motor bicycles over 150 lbs. in weight were allowed thirty per cent. extra fuel. The machines had to be driven at the rate of 20 m.p.h., and the competitors had to complete the course in not less than fifteen minutes and not more than twenty minutes. No pedalling was permitted after crossing the starting line. The starters, together with their petrol allowances, and the weights of their machines and themselves, were as follows:

Class I., for single-cylinder motor bicycles, W. A. Jacobs ($3\frac{1}{2}$ h.p. Baby Rex), 21 ozs. 4 drs., weight of machine 174 lbs., weight of rider 157 lbs.; J. S. Holroyd ($1\frac{1}{4}$ h.p. Motosacoche), 18 ozs. 3 drs., 103 lbs. and 156 lbs.

Class II. (for multi-cylinder machines), R. C. Davis ($5\frac{1}{2}$ h.p. twin Griffon), 31 ozs. 2 drs., 249 lbs. and 151 lbs.; G. L. Fletcher ($2\frac{3}{4}$ h.p. twin Douglas), 20 ozs. 1 dr., 145 lbs. and 158 lbs.; B. C. Cumberland (5-6 h.p. four-cylinder F.N.), 30 ozs., 1 dr., 222 lbs. and 152 lbs.; W. W. Douglas ($2\frac{3}{4}$ h.p. twin Douglas), 19 ozs. 4 drs., 122 lbs. and 157 lbs.; E. Clark ($2\frac{3}{4}$ h.p. twin Douglas), 20 ozs. 3 drs., 124 lbs. and 183 lbs.; H. G. Bell (2 h.p. twin Moto-Rève), 18 ozs. 2 drs., 104 lbs. and 149 lbs.; L. A. Baddeley (2 h.p. twin Moto-Rève), 18 ozs. $2\frac{1}{2}$ drs., 99 lbs. and 155 lbs.; J. V. Robinson ($2\frac{3}{4}$ h.p. twin Douglas), 20 ozs. 2 drs., 150 lbs. and 154 lbs.

Class III. (for passenger machines) was represented by P. James (8 h.p. Chater-Lea and sidecar), total weight 6 cwt. 1 qr. The tanks were emptied, and the allowances poured in.

It was still raining when the competitors were started by F. J. Jenkins. One or two, owing to air locks in the petrol pipe, had a difficulty in getting away. One of these was

R. C. Davis ($5\frac{1}{2}$ h.p. Griffon) starting. He proved the ultimate winner.

Bell. As soon as all the men had got going F. J. Jenkins drove his smooth running 15 h.p. Rover car round the course in the reverse direction to that in which the competitors were travelling. The roads were exceedingly heavy, and it seemed certain at the outset that many would not travel far on their allowances. Holroyd was encountered stopped on the first hill, and Bell, Baddeley, Clark, and Douglas were seen at Fulmer. Cumberland's F.N. was also seen at this spot, a sparking plug having failed after the second lap.

Neither W. A. Jacobs nor J. S. Holroyd completed the first round. Fletcher, Cumberland, Davis, and Robinson completed the first and second rounds, and eventually Davis ($5\frac{1}{2}$ h.p. Griffon) was proved to be the winner, having covered three and threequarter rounds. Robinson came second, three and a half rounds, and Fletcher was third, having covered two and threequarter rounds. James's Chater-Lea and sidecar covered two and a half rounds.

Competitors in the M. C. C. consumption trial on Saturday. From left to right, J. V. Robinson, W. A. Jacobs, J. S. Holroyd, R. C. Davis, W. W. Douglas, Eli Clark, and H. G. Bell.

CLUB NEWS.

Surrey M.C.C.

A twelve hours' reliability run to Weymouth and back has been arranged for Wednesday, the 15th inst.; start Bush Hotel, Farnham, 8 a.m. Members are reminded that they must give notice to the hon. secretary, Mr. Edward Cox, 164, High Street, Guildford, not later than Saturday next, enclosing entrance fee, 2s.

York County M.C.C.

The annual speed trials were held on the Low Road in the grounds of Temple Newsam, by permission of the Hon. G. Wood. The principal event was for the Charge Challenge Trophy—holder, H. Wilson, Harrogate, who did not defend it this year. The distance was a quarter of a mile, flying start. The club's electrical timing apparatus was used, and in the capable hands of A. E. Simpson answered perfectly. Much amusement was caused by a rider who, whilst competing in his heat, was unfortunate enough to run over a fowl. He had, of course, to pull up, but it was a curious sight to see him return along the course and gather up a handful of feathers as evidence to the judge that he had met with an obstruction, and thus be allowed another trial. After some good sport, C. S. Allen (3½ h.p. Triumph) was declared the winner, and holds the trophy for one year. The starter was H. Noble.

Western District M.C. (London).

The start for the Petrol Consumption Test fixed for Saturday next, the 11th inst., will be from Gerrard's Cross. Members are asked to be at the Bull Hotel not later than 3.30 p.m. A circuit of about seventeen miles, *via* Slough, including two businesslike hills, has been chosen, and competitors will be required to cover this once. Two classes will be arranged—Class 1 for single-cylinder machines, and Class 2 for multi-cylinder machines. Tanks will be filled at the start, and on completion of the circuit the amount required to again fill the tank will be carefully measured. The entrance fee is 2s. 6d.

The results of the annual hill-climb, as published last week, have been confirmed by the committee.

The run next Sunday is to Leith Hill.

Leeds M.C.C.

Some thirty-five members took part in a team trial to Bridlington on Saturday last. The captain of each team had to say what time they would arrive in Bridlington, and the team arriving nearest to the stated time were to be declared winners. The weather was glorious, and the different teams were despatched at intervals by P. Cockcroft. There was a good crowd to see the start, and each team left with the good wishes of their respective friends. The result being so close, it has been withheld until the next issue.

Essex M.C.

The results of the twenty-four hours' ride from Woodford to York are as follows, showing the number of minutes and seconds by which the riders varied from schedule: G. Lee Evans, 28m. 24s.; G. Fletcher, 32m. 17s.; F. G. Smith, 36m. 1s.; W. H. Wells, 43m. 12s.; B. A. Hill, 43m. 56s.; F. C. Wood, 81m. 12s.; W. Cooper, 88m. 13s.; F. W. Applebee, 138m. 30s.; F. A. Hardy, 156m. 24s.; C. Janssen, 181m. 8s.; and A. Peppercorn, 388m. 15s. The remainder of the riders did not complete the journey in time. The

Competitors in the Worcestershire M.C.C. reliability trial to Rhayader and back. Anent the discussion which is now going on as to holding Sunday competitions, we are told that this competition was held on Monday, 30th ult., but a member of our staff who happened to be touring in that neighbourhood is very much mistaken if he did not see the competition in progress on the previous day.

Palmer Cup has therefore been awarded to G. Lee Evans, and gold medals are awarded to all those whose times are given above.

Bradford M.C.C.

On September 12th a 150 miles reliability trial for members who have not yet won a gold medal for reliability has been arranged. Awards, Rex Cup (value ten guineas) and gold, silver, and bronze medals for first, second, and third.

Middlesbrough and District M.C.C.

A fuel consumption trial was held on the 1st inst. The course was one of thirty-one and a half miles, starting from Marton Bungalow. The prize, which was kindly provided by Mr. J. Bellerby, was won by J. H. Dale (1909 Triumph), his consumption working out at a gallon per 198 miles.

Leeds M.C.C. team trial to Bridlington on Saturday last, in which some thirty five members took part.

News.—

North-West London M.C.C.

Members are reminded of the picnic lunch on September 11th. The spot chosen is one of great natural beauty.

Bradford M.C.C.

The winner of the passenger motor cycle reliability trial referred to in the last issue was S. Johnson (De Dion Bouton). C. L. Bedford (5 h.p. Vindec and sidecar) was second, J. W. Leach (5 h.p. Rex tricar) third.

The Harrogate and District M.C.C.

The above club is holding a reliability trial on September 11th, and would like a control at Kirkby Lonsdale. Will the local motor cyclist act as checker? The competitors are due at Kirkby Lonsdale about 3.30 p.m. Letters should be addressed to H. W. Fortune, St. James's Chambers, Harrogate.

Northamptonshire Motor C.C.

The annual hill-climb was held on the 28th ult., the club being unluckily compelled to seek a venue outside the county boundaries. A hill close to the town was originally selected, but the county police offered no objection, but as the district council, under whose jurisdiction the road was, refused their sanction, the club had to go outside the county, so that local riders were deprived of the opportunity of witnessing the event, and the participants and spectators spent their day elsewhere. An easy hill on a lonely road, free from traffic and remote from houses, was selected, and good performances were recorded.

Rider and machine.	Time.	Position on
M. S.	formulae.	
TWIN-CYLINDER CLASS.		
Gainsford (6 h.p. Advance) ...	54½	1
Leadbeater (5 h.p. Rex) ...	57½	2
¾ H.P. REX AND TRIUMPH CLASS.		
*Lees (¾ h.p. Triumph) ...	51½	1
*Underwood (¾ h.p. Triumph) ...	51½	3

Barratt (¾ h.p. Rex sidecar) ...	1 56½	3

It had been agreed beforehand that if two riders in any class were close together for the fastest time prizes, they could ride up the hill again alongside each other. Consequently two classes required a deciding heat, Lees riding Underwood in Class II. and Jolley riding Andrews in Class I. Exciting results were seen in Class II., three extra attempts being required before Lees was finally declared the winner. The first time Underwood started with his petrol shut, and Lees in sportsmanlike fashion offered a second

run. This time Underwood caught Lees on the finishing line, a dead heat being recorded. At the third attempt Lees won by a few yards. In Class III. Andrews failed to achieve the speed of his timed ascent, and Jolley won easily on his three-year-old machine.

A gold medal for the highest efficiency of the day, considering weight, speed, and horse-power, was won by Lees (¾ h.p. Triumph).

Bolton and District Motor Cycle Club.

The above club held a successful reliability trial on Saturday, the 28th ult., the trial being to Skipton and back, a distance of 120 miles. Results:

	Points.
A. Richards (2¾ h.p. Minerva), non-stop ...	100
J. Fishwick (¾ h.p. Triumph) non-stop ...	100
H. Dootson (¾ h.p. Triumph), non-stop ...	100

J. Nuttall (5 h.p. Vindec), non-stop ...	100
J. Entwistle (¾ h.p. Triumph), retired carburettor trouble.	

S. Groom (¾ h.p. J.A.P.), one stop belt trouble 95
The event will be re-run over the same course on Saturday next, the 11th inst., starting from Crofters at 1.30 p.m.

Brighton and District Motor Cycle Club.

A very interesting afternoon's sport was witnessed by the members of the above club on Saturday, 28th ult., when a match between Mr. J. Harwood (¾ h.p. Triumph) and Mr. F. T. Turpin (¾ h.p. Bradbury) was decided on Saddlescombe Hill, a rather steep gradient. The conditions were the fastest time in three ascents each to be the winner, and as the competitors had three consecutive dead heats the last attempt was very exciting, resulting in a win for Mr. Turpin on his Bradbury. It might be added that Mr. Turpin carried weight on his machine to make up the difference in the rider's weight, one condition of the match. The timing was electrical. The club is holding a speed-judging competition on Saturday, the 11th, and would always welcome any other motor cyclists in the district at its competitions.

Motor cyclists who write to manufacturers on any subject should be particularly careful to write clearly their names and addresses. A. C. Davison, tank manufacturer, Camden Town, informs us that he received recently two letters—one from Canewdon, Essex, and the other from Bala, North Wales—to which he is unable to reply owing to the signatures and addresses being quite illegible.

Under the heading of "An Exciting Adventure," in the issue of August 19th, we published a description of how a motor cycle caught fire in Scotland through the petrol leaking from the top portion of the tank and being set on fire by the flame of the acetylene lamp. The Continental Tyre and Rubber Co., Ltd., write: "Although the flames were licking round this machine for threequarters of an hour, the belt, which was one of our manufacture, was very little damaged, and was used the next day a distance of seventy miles over hilly country."

At the foot of Dashwood. Competitors in the Western District M.C. hill-climbing competition referred to in last week's "Club News."

T.T. RACE WEEK.

EVERYTHING points to the motor cycling week in the Isle of Man being a great success. The entries for the Tourist Trophy Race on the 23rd have eclipsed all previous records by reaching a total of fifty six, of which twenty-eight are single-cylinder entries, twenty-five twin-cylinder entries, one four-cylinder, and two not specified. Of the above twenty are private owners. The entries received since our last list was published include a Scott, a Peugeot (to be ridden by the famous Giuppone, entered by J. Taylor, Birmingham), a 5 h.p. Tee-Bee-J.A.P. (entered by a private owner), and another Irish entry (no confirmation received). It suffices to say that this year's T.T. Race will, provided the weather is fine, prove to be not only the most sporting event of the year, but also probably the best of this series of motor cycle races yet held in the island. It is expected, therefore, that interested spectators will flock over to the island in their hundreds, and, though as far as we can hear at present, the railway companies have made no special arrangements, the London and North-Western has its usual excursion to Douglas during the month of September, leaving Euston at 12.30 midnight on Friday and at 10.30 a.m. and 5.30 p.m. on Saturday for three, eight, ten, fifteen, or seventeen days at 25s. return for the double journey third class and steerage or 29s. return third class and saloon. The L. and N.W. Railway and the other railway companies are being approached, and if any special excursions are to be run they will be announced in these pages. On the day after the T.T. Race a hill-climb will be held on Kewague and Richmond Hills. Kewague is situated about one and a half miles from Douglas, and is reached by following the road on the south side of the harbour towards Castle-town. Half a mile from the first milestone from Douglas the right fork is taken, and then the climb begins. The road rises from 77 to 255 feet in about half a mile (maximum gradient about 1 in 9), and then falls to 195 feet (gradient about 1 in 34), the climb finishing up Richmond Hill, which rises to approximately 47ft. The hill is said to be quite straight. The following classes have been formu-

lated: Class I. for genuine standard tour machines not exceeding 750 c.c. Class II. for single and Class III. for multi-cylinder machines which have actually taken part in the T.T. Race. Class IV. for privately owned machines with engines not exceeding 750 c.c. and Class V. for all comers, open machines with engines the cubical capacity of which does not exceed 1,000 c.c. Besides these two interesting events, the beauty of the island and the fact that it possesses good roads should be a further inducement to many motor cyclists to witness the race. Visitors, however, should bear in mind that the Isle of Man is not the driest spot in the British Isles, and clothing to withstand the wet should be taken.

THE COMPLETE ENTRY LIST.

The entries total fifty-six, or nineteen more than were received for the 1908 T.T. Race. They are:

J. Marshall (3½ Triumph) (holder)	J. Baxter (5 Rex)
H. Reed (5 Dot) (holder of Twin Trophy)	J. C. Smyth (3½ Rex)
Norton Mfg. Co. (3½ Norton, 496 c.c.)	R. Lord (3½ Rex, two-stroke)
Noel E. Drury (5 J.A.P., 680 c.c.)	G. E. Stanley (3½ Premier)
C. B. Franklin (3½ Triumph)	B. B. Jones (3½ Premier)
W. H. Wells (5 Indian)	Wm. Heaton (3½ Rex)
W. H. Wells (5 Indian)	H. L. Cooper (3½ Triumph)
S. C. Perryman (5 Norton)	F. C. Bagshaw (5 Rex)
R. Ellis (3½ Rex)	A. J. Moorhouse (5 Rex)
F. A. Applebee (Rex)	Rem Fowler (5 Rex)
O. C. Godfrey (Rex)	Thos. Greer (5 Rex)
W. Grimstead (5 Rex)	C. Wilson (3½ Rex)
J. F. Jones (3½ Triumph)	N.S.U. Motor Co. (4 N.S.U.)
W. O. Bentley (3½ Rex)	Eric Myers (3½ Scott, two stroke)
C. E. Murphy (3½ Triumph)	H. H. Bowen (Bat)
Jas. Stewart (3½ Triumph)	G. L. Fletcher (4 Indian)
H. A. Collier (6 Matchless)	W. Newsome (3½ Triumph)
H. V. Colver (3½ Matchless)	A. G. Fenn (3½ Triumph)
C. R. Collier (5 Matchless)	P. Butler (5 Dot)
W. H. Bashall (Bat)	H. D. Blake (3½ Triumph)
J. T. Bashall (Bat)	W. McMinnies (3½ Triumph)
Hugh Gibson (3½ Triumph)	J. Giuppone (3½ Peugeot)
T. A. Carter (5 Rex)	R. O. Clark (F.N., four cylinder)
A. J. Sproston (5 Rex)	J. Lang (5 Tee-Bee-J.A.P.)
Jas. Adamson (3½ Triumph)	H. Martin (5 Martin)
L. C. Munroe (5½ N.S.U.)	S. W. Dayrell (5 Bat)
R. M. White (3½ Brown)	J. Leno (3½ Premo, two stroke)
R. M. Brice (3½ Brown)	A. N. Other (—)

HOW TO GET TO THE ISLE OF MAN.

As numbers of motor cyclists will be journeying to the Isle of Man for the T.T. Race, we give below particulars of two or three of the routes to the island, *via* Liverpool, Heysham, and Fleetwood. From Liverpool to Douglas the Isle of Man Steam Packet Co.'s boats sail as under, Sundays excepted:

September—1st to Monday 20th.

FROM LIVERPOOL.	FROM DOUGLAS.
Daily...10.30 a.m. & 2.45 p.m. Extras.	Daily 9 a.m. & 3.30 p.m. Extras.
4th 9.45 a.m.	Every Monday ... 12.30 a.m.
10th 12.50 night	(Sunday night)
25th ...5.30 p.m. & 12.50 night	

September—Tuesday, 21st to 30th.

FROM LIVERPOOL.	FROM DOUGLAS.
21st to 24th 11.30 a.m.	21st to 24th..... 9.0 a.m.
25th ... 10.30 a.m., 5.30 p.m., and 12.50 night	25th 9 a.m. & 3.30 p.m.
27th ...10.30 a.m. & 2.45 p.m.	27th 9 a.m. & 3.30 p.m.
28th, 29th & 30th 11.30 a.m.	27th ...12.30 a.m. (Sun. night)
	28th, 29th & 30th... 9.0 a.m.

The fares are: Liverpool or Fleetwood to Douglas—Ramsey, first-class saloon return 10s., third-class steerage return 6s. Motor cycle fares.—Single journey with passenger, motor bicycles, 2s. 6d.; motor bicycle with trailer or sidecar, 5s.; tricars, 7s.

FLEETWOOD TO DOUGLAS.

Fleetwood dep... 10.30 a.m.	Douglas dep..... 3.30 p.m.
Douglas due..... 1.10 p.m. a	Fleetwood due.... 6.40 p.m.
a 1.40 p.m. 13th to 25th.	† { 6.10 p.m. 1st to 11th.
	† { 6.40 p.m. 13th to 25th.

Fares same as Liverpool to Douglas.

From September 15th to 27th.

HEYSHAM TO DOUGLAS.

Heysham dep. ... 3.0 p.m.	Douglas dep. 9.0 a.m.
Douglas arr..... 5.40 p.m.	Heysham arr. 11.40 a.m.

We are advised by the Premier Cycle Co., Coventry that they have recently had the pleasure of supplying a Premier motor bicycle to Sir William Miller, Bart.

The old way and the new way.

- ¶ The old way was to start with frantic pedal exertion, or to vault into one's saddle—the aid of a stand was often indispensable. The ROC invented the new way.
- ¶ When you see a rider, or a rider and passenger, start on a gradient from rest and glide away without concern, you wonder there are left any who are content to go on using the old way.
- ¶ You know that for starting, for stopping, for climbing, for traffic, the ROC live axle way is the best way of all. You know it is at least the most popular, and the other firms now using it by license is proof of its worth.
- ¶ But you may not know how easily this invention can be added to YOUR machine. The ROC gear box is now improved by its mounting on ball bearings, giving remarkable smoothness in running and long life. The complete conversion occupies but three or four days. Deliveries of sets for Triumph machines from stock. Send your machine now and get the benefit for autumn and winter use. The inclusive charge is twelve guineas. It doubles your pleasure.
- ¶ Get particulars also of the famous ROC Military models. 4 h.p. single and 5/6 h.p. twin.

A. W. WALL, LTD., Roc Motor Cycle Works,
Aston Road, and Dartmouth Street, **BIRMINGHAM.**

For the lover

of comfort, there has never been a happier combination than the 6 h.p. Twin N.S.U. and the practically-built

N.S.U. Sidecar.

With this attachment you can take any corner to right or left at a high speed; you can negotiate a highly cambered lane with perfect ease, and, owing to its sensible adjustment conversation can be enjoyed without unduly raising the voice. It's superbly finished too. Why not drop us a line?

N.S.U. MOTOR COMPANY, LIMITED.

Offices and Showrooms—186, Great Portland Street, London, W.

THE SPLENDID SUCCESSES WITH THE
'ZENITH-GRADUA'

Mark it as the
Leading Touring Machine

All machines tested on BROOKLANDS Track and Test Hill.

The
'ZENITH.'

Fitted with the
'Gradua' Gear.

AT COVENTRY it showed its qualities as a hill-climber, which is the essential feature of a touring mount. 7 first awards out of 10. A machine which will do this, and yet be fast on the level, commends itself to everyone.

The Gradua Gear is very light on belts; it is the exception to pull out a fastener even on the track. The extraordinary results which an infinitely variable gear give, can hardly be believed without a trial.

We can arrange a trial by appointment at Brooklands.

"TRIUMPH"
CONVERSIONS.
12 Gns. (fitted).

ZENITH MOTORS, LTD.,
WEYBRIDGE. (Phone No. 4.)

P.S.—A "Zenith-Gradua" is on view at The Service Co., High Holborn; and at Sherwell's, 46, York St., Westminster.

PALMER
TYRE

EDINBURGH MOTOR CYCLE CLUB FIVE DAYS' TRIAL.

Rider of Palmer Tyres, **FIRST CLASS MEDAL** and **SPECIAL PRIZE PERFORMANCE ON BRITISH MADE TYRES.**

A.C.U. SIX DAYS, TRIALS.

Awards to riders of Palmer Tyres, **SIX GOLD MEDALS,**
TWO SILVER MEDALS, 1908 and 1909 (to date.)

68 MEDALS and 10 CUPS WON ON
PALMERS.

Write for descriptive booklet—

THE PALMER TYRE, LTD., 119, 121, 123, Shaftesbury Avenue, London, W.C.

Depots—London, Paris, Glasgow, Birmingham, Coventry, Nottingham, and Amsterdam.

In answering these advertisements it is desirable to mention "The Motor Cycle."

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Hand-solutioned Patches.

[4240.]—Perhaps you can offer an explanation of Mr. H. Davies's remarkable statement in the issue of August 14th, under the heading of "Long Distance Trial Riding," that it is seldom that a hand-solutioned repair is reliable on a motor cycle. Although I ride at fairly high average speeds I have never been troubled by a patch coming off, or peeling, and I do not see why anyone else should be if he uses the right patches and puts them on properly. A.T.B.

Meet of Passenger Motor Cyclists.

[4241.]—I think the thanks of those who attended the meet of passenger motor cyclists at Stratford-on-Avon on August 7th (which was a great success) are due to Mr. H. Morley, who not only suggested the meet, but also made many very good suggestions, which if carried out will, I am sure, tend to still further popularise this very useful and inexpensive form of motoring. I am sorry that no formal vote of thanks was made to him at the time.

H. MORLEY.

Valve Trouble.

[4242.]—Most riders of this year's machines will, I think, agree that the valves break much too frequently. The screwed-in stem type nearly all break at the thread. The stems are of good thickness, but of course the strength is reduced at the thread, i.e., where the stem is screwed into the head, and where the greatest heat is. This portion should be made much thicker, but I think it would be much better to pass the stem right through the head and up to the shoulder, and rivet it over under great pressure. If properly made, I do not think it should either work loose or leak, and I think it would last indefinitely. Does anyone make a valve in this manner?

ALL BUT SATISFIED.

The Sincerest Form of Flattery.

[4243.]—Would it not be better if designers, instead of copying their neighbours' machines, tried to improve their own mounts? Nearly every other motor bicycle one sees is a copy of the Triumph. I suppose this is due to the magnificent success of these machines. But although they are first-class there is still room for great improvement. It is generally thought that magnetos should be protected from mud, dust, and weather, but we find them on our premier machine placed so as to get all three.

In *The Motor Cycle* of June 23rd you publish a memorandum from the Rex Manufacturing Co. describing their Speeding models, which says: "... Holes are also pressed in all parts where lightness can be obtained without loss of strength." If this can be done on racing machines, which are made to travel at full speed regardless of road surface, why is it not done on touring mounts which are driven carefully?

Do makers really think that because a lever governs the tank it is less inconvenient on the side of the tank than a similar lever governing the throttle or air? If not, why don't they provide magneto handle-bar control?

Now one more complaint and I am done. Why is the oil tank always put in front of the petrol tank, so that the rider has to bend down to manipulate the pump? If the oil tank were put over the petrol tank, as in the Davison tanks, the pump could be placed within easier reach of the rider's hand. Perhaps it is useless for me to complain. Designers seem to be somnolent. Perhaps only a Blériot will wake them.

IK 375.

Hill Climbing.

[4244.]—Being interested in these "impossible to climb" hills I went out to Mow Cop from Stafford with the intention of climbing it, a feat which I managed first time, right from the station to the top. I was using a 5 h.p. twin pedalless machine geared 4 to 1. The surface of the hill is in rather worse condition now than it was when the writers of letter No. 4158 rode up it. It has just recently been laid with new metal, or rather a mixture of cinders and gravel, for about ten yards on the steepest portion of the hill.

E 927.

[4245.]—During a tour in the Highlands last month I climbed Bealach-nam-Bo (the Pass of the Cattle), which takes one over from Loch Kishorn to Applecross, and is, in fact, the only road leading to Applecross. When in Applecross I was told that I was the first motor cyclist that had been over the pass; at any rate, I was the first to visit Applecross.

It would be interesting to hear if any of your readers can claim to have climbed this hill or if any have attempted to climb it. The road rises on either side from the sea level to 2,053 feet in five miles on one side and in six miles on the other. The gradients near the summit are very stiff, and the surface is terrible. The machine I was riding is a 1908 Triumph fitted with a Nala gear.

I should like to mention that during my tour I used R.O.M. tyres, and have no hesitation in saying that they are the only tyres I know of that would have withstood the terrible road surfaces I encountered. The road is shown on Route 330 of "Inglis's Contour Road Book of Scotland."

C. R. NANSON.

Silence.

[4246.]—In reply to letter 4211, we think that the scavenging action of the 5ft. exhaust pipe, as fitted by Mr. Grafton, would prove particularly advantageous to a two-stroke engine. This idea, which was first introduced by Mr. J. Atkinson, M.I.M.E., in the Crossley gas engine, was fitted in 1904 to the early two-stroke motor cycle, illustrated in *The Motor Cycle* of May 12th, and proved most effective.

Although Mr. Atkinson found it necessary to have 65ft. of exhaust pipe we consider that an effective scavenging effect is gained by the passage of the exhaust at a maximum speed of 100ft. per second through a straight pipe 5ft. to 6ft. long.

The only objection to this device is the difficulty of arranging for such a long exhaust pipe in place of the more compact arrangement of the ordinary silencer.

THE SCOTT ENGINEERING CO.

[4247.]—From correspondence in *The Motor Cycle* I see that this question has been taken up again. In one way the experiments referred to show a great improvement, i.e., the tendency to make larger expansion chambers and to procure a gradual outlet of the gases through flattened pipes, as is found on most cars.

The drilling of extra holes in the silencer provides a too sudden escape of the gases, and this, together with the "ring" of the metal, helps to increase the noise. These are the main points to look after, then it will make very little difference how many plates are fitted inside so long as no back pressure is created.

I have found the simpler a silencer the better it is, cheaper to make, and easier to clean out. Sometimes the

weight is also a consideration. My silencer for a 4 h.p. 85 by 95 mm. engine, which runs up to 3,000 r.p.m. on the road (3,600 on the stand), is very effective, therefore the following particulars may be of interest: Internal diameter of exhaust pipe $1\frac{3}{16}$ in., round box 3 in. by 11 in., held together by a lin. pipe, having four rows of 5-32 in. holes in it, fifty holes in all. The outlet is an elbow piece reduced to $\frac{5}{8}$ in. diameter. This latter is only screwed on to the pipe to prevent the gases exhausting straight on to the back tyre, but there is no difference noticeable when it is removed. The back pressure is not measurable. Your paper is very much appreciated here in our motor cycle club. R.R.
Berlin.

An Old Complaint.

[4248.]—I should like to say a few words in reply to letter No. 4216, August 25th. I cannot understand why "Hibernian" should find any difficulty in obtaining petrol in less quantities than two gallons. Perhaps it is because he calls at hotels for it. I have had no trouble in this way, and I have toured nearly all the South of England and a good part of the Midlands.

I also supply petrol myself, and many a time I have put as small a quantity as one quart into a motor cycle tank.

COUNTRY AGENT.

Two Stroke Engines.

[4249.]—I have great pleasure in replying to letter 4219, and am rather sorry I have not successfully dispelled Mr. Rendall's objections. With reference to the first objection, the editor has already answered this, but in the larger and earlier type of Scott engine non-return valves were fitted with great success. In his second he brings forward one of the time-worn arguments against this type of motor, alleging loss of power owing to inefficient suction. The excellent example set at various times with this motor ought to have sufficed as an answer, and I can assure our friend that there is no loss of power from this cause.

I was pleased to see Mr. Rendall intends personally to test the Scott machine, as I think that, in this way, he will set all his previous objections at rest. Personally, I am of the opinion that several readers of *The Motor Cycle* would be grateful for his experience with this motor, seeing he advocates the displacer type so strongly.

P. MORRISON MACINTYRE.

Surface Evaporation.

[4250.]—While partly agreeing with what "Cygnus" says in the issue of August 18th about surface carburetters, I should like to give my experiences of a surface carburetter extending over three years and for many thousands of miles, winter and summer alike.

I like a surface for the following reasons: (1) No choked jets; (2) perfect regulation of gas and air; (3) no flooding of carburetter after every stop; (4) less overheating of engine.

But I dislike it for the following reasons: (1) Great difficulty in starting in cold weather with anything except fresh petrol; (2) difficulty in finding correct position for air lever when first starting; (3) nuisance of having continually to open needle valve to carburetter to keep it filled to correct level, and sometimes forgetting to shut off, with consequent flooding and waste.

I must admit the surface carburetter has certain advantages, but I consider they are far outweighed by its disadvantages. Its disadvantages in cold weather are very great. As a case in point, I may mention I once pedalled my machine eight miles through snow owing to the petrol being too dense to vaporise. Of course a surface was quite satisfactory years ago, when the spirit was only .680; but now, when most of it is .720 to .725, it makes all the difference.

I have had no experience of the wick type, which I believe is the most satisfactory of all.

I hardly see the point of the remark "Cygnus" makes about the machine being "festooned" with wires for handle-bar control. Two short wires, quite out of the way, that is all—fewer even than the old type levers.

I consider that, provided the petrol is properly strained through very fine gauze, the jet type is much the best for all-round work. And after all that is what we motor cyclists want—a machine that will work equally well both winter and summer.

R. H. DICKMAN.

Magnetos and Sparking Plug Gap.

[4251.]—Occasionally I read in *The Motor Cycle* reference to the adjustment of the points of the sparking plugs used with magneto ignition, and there appears to be within limits, some latitude in the size of gap that is advisable. However, the closer the points the better the run, as might be expected. I ride a 5 h.p. twin Norton-Peag and since changing from accumulator to magneto ignition have set my plug points (ordinary J.A.P. plugs, single point good enough for anything) one-hundredth of an inch apart, using an engineer's feeler gauge for the setting. I never have the least trouble when starting or running, and careful oiling scarcely ever get stopped. I have not touched the magneto, beyond careful cleaning and oiling, in all 1,500 miles running, which I understand is not an uncommon achievement. A friend of mine—a doctor—who has magneto ignition in his car, and whom I advised as above, writes: "We were hampered considerably by the failure of the magneto . . . but since receiving the feeler gauge adjusting sparking plugs properly have had no further trouble, either in running or in starting. She starts at once."

AB 66

A Reminiscence of the Six Days' Trials.

[4252.]—Owing to the impossibility of writing to each man individually, I shall be very grateful if you will kindly allow me a little space to heartily thank, on behalf of the Shropshire M.C.C., the competitors and officials in the recent 1,000 miles trials, and also all others who so generously subscribed for a silver cup to be presented to them. The cup has now arrived, and is a magnificent one—an acquisition

Survivors in the Woodford to York and back 24 hours run. F. A. Harcourt (3½ h.p. Norton) and F. C. Wood (4 h.p. N.S.U.)

indeed to a club which was only formed this year. A meeting of the committee will shortly be held to determine what form the competition for its possession shall take, and will be announced in *The Motor Cycle* under "Club News."

It is hoped that Shrewsbury will again be chosen as centre for the trials, when it will be a pleasure to the S.M.C.C. to help the officials and competitors in any way they can.

HAROLD G. POTTS, Captain S.M.C.C.

EXPERIENCES WANTED.

"S. G. L." would like readers' experiences with Palsby Cord motor cycle tyres.

"Excelsior" wishes to thank those readers who so kindly answered his enquiries.

"H. W. W." would like readers' experiences with cooling on a 6 h.p. J.A.P. engine used to propel a sidecar. Will the fan prevent engine overheating when it is run free engine clutch in traffic?

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

Going out of Town
for a few days?

Then be sure that your tyres are of the right kind, of the right weight, and quality.

That is to say, be sure they are

MICHELIN

Motor Cycle Tyres.

Michelin wired motor cycle covers of 2, 2 $\frac{1}{4}$, and 2 $\frac{3}{8}$ inch section are interchangeable: they will all fit the same rim.

The same remark applies to the 2 and 2 $\frac{1}{4}$ inch beaded covers.

Your Agent can supply you.

MISCELLANEOUS ADVERTISEMENTS.

PRICES.

ADVERTISEMENTS in these columns—9d. per line of 8 words; minimum, two lines. Name and address must be counted. Thus—

Two lines (16 words or less) costs 1/6
Three lines (24 words or less) costs 2/3
Four lines (32 words or less) costs 3/-

In the case of Trade Advertisements a series of thirteen insertions is charged as twelve.

All advertisements in this section should be accompanied with remittance, and be addressed to the offices of "The Motor Cycle," Coventry. To ensure insertion letters should be posted in time to reach the offices of "The Motor Cycle," Coventry, on the Thursday morning, or if sent to London (20, Tudor Street, E.C.), by the Wednesday afternoon previous to the date of publication.

All letters relating to advertisements should state distinctly under what heading and in what issue the announcement appeared.

CLASSIFICATION BY LOCALITY.

For the convenience of purchasers of second-hand motor cycles, the advertisements are classified into districts, as many readers like to know what machines are for sale in their immediate neighbourhood before going further afield.

TREMENDOUS DEMAND FOR —“CORONET” SIDECARS.—

We have laid down a special plant for the produc-
tion of High-class Sidecars, and the unique system
we employ enables us to turn out great quantities
at about half the usual price charged by some
makers. We guarantee our Sidecars to be identical
in quality to some makes sold at £9. We use
genuine Chater Lea lugs, double C springs, best
weldless steel tubing, best tyres. They fit either
right or left side; detached in three minutes.

Price £4 17s. 6d. each.

Delivery from stock to suit any make of machine—
Rexes, Triumphs, Minervas, N.S.U.'s, Rocs, etc., etc.

THE T.T. AND TWO-STROKE ENGINES.

READERS will have noticed that among the entries for the Tourist Trophy Race published last week appear three motor cycles fitted with two-stroke engines. One is the Scott, already fairly well known; the remaining two are newcomers—the Premo and the Rex. The first named has a water-cooled twin-cylinder engine, while the others have air-cooled single-cylinder engines. The maximum cylinder capacity in the T.T. Race is 500 cubic centimetres for single-cylinder engines, and 750 c.c. for twins, but many have overlooked the fact that, for the purpose of placing two and four-stroke engines on terms of equality when racing in competitions, the A.C.U. decided last year that the cubic capacity of a two-stroke engine should be multiplied by 1.25 in the case of air-cooled cylinders and 1.32 for water-cooled cylinders. The cubic capacity of the water-cooled Scott engine when handicapped in this manner is 584 c.c. and the limit is 750 c.c.—a very wide gap, but the single-cylinder Rex and Premo machines being in the neighbourhood of 470 c.c., are, when the addition is made, considerably over the 500 c.c. limit for single-cylinders, and were therefore considered ineligible for the T.T. The A.C.U. has therefore decided to accept the Rex entry of a four-cycle single-cylinder machine as a substitute, and the makers of the Premo are fitting a cylinder of smaller dimensions to enable it to come within the limit. This is a satisfactory compromise, but it is a great pity that the two-stroke engine should not have a chance to show what it can do against four-stroke engines of equal size without a handicap. We may here interpose that we are not criticising the decision of the A.C.U., but merely commenting on

the facts of the case. The T.T. Race is being run on a cylinder capacity limit. There is no fuel limit and no formula will be used to decide the result. Why therefore should not a two-stroke engine be allowed to compete without the handicap? If without any increase in weight or bulk it can on the average beat the four-stroke engine for speed and hill-climbing (which at the present stage we very much doubt), it is a pity that it should have a handicap placed upon it. The fuel consumption of a two-stroke engine is greater than a four-stroke of equal size, but as there is no fuel limit in the race under discussion that does not count. In the case of a hill-climbing competition, the results of which are decided on a formula, probably the handicap framed by the A.C.U. is the fairest method of placing all on an equality which can be devised. This is because in most motor cycle hill-climbing competitions the formula used is the A.C.U.

$C \times T$

or Professor Callendar's formula, $\frac{C \times T}{W}$, and any

two-stroke engine is almost certain to win where cubical capacity is such a big factor in the sum. The Tourist Trophy Race is quite a different event from a hill-climb, or, in fact, any other motor cycle competition, because it is ostensibly promoted to improve the ordinary everyday touring mount. By handicapping a machine its best points are not brought out. A two-stroke or any other type of engine might with encouragement prove to be superior to types at present in vogue, whereas if it never has a chance to shine, improvements will only be effected by a slow and laborious process of the survival of the fittest.

International Tourist Trophy Race, September 23rd.
COMPLETE LIST OF ENTRIES.

THE following table is a complete list of all the entries for the International Tourist Trophy Race in the Isle of Man on Thursday of next week. Never in the history of the race has such a large and representative entry been secured, and we congratulate Mr. F. Straight and the executive of the Auto Cycle Union on their success. In addition to the well-known makes of machines, practically all of which are represented, there are names of motor

cycles which have not previously competed in a T.T. Race. The Indian, Premier, Scott (two-stroke), Martin, and Premo (two-stroke) are all fresh aspirants to T.T. honours. Let us hope the weather will be propitious and that no incident will occur to mar an enjoyable day's sport. "The battle of the cylinders" promises to be as exciting as the race for the Tourist Trophy itself, while all will agree that the organisers have been very generous with the cash prizes.

 HEIGHTS IN FEET 250.

Scene of Operations in the Isle of Man.

THE T.T. RACE.

On Thursday, the 23rd inst., there is the race for the Tourist Trophy over the triangular course, starting from St. John's, and thence by way of Ballacraine, Creg Willey's Hill, Kirkmichael, Peel, and back to St. John's. Competitors will make ten complete circuits of the course, or a total distance of 158 miles 220 yards. Start 10 a.m. There are fifty-eight competitors.

THE HILL-CLIMBS.

Next day (Friday) at 10 a.m. there is a hill-climb up Kewagie Hill, near Douglas, and in the afternoon at 2.30 another climb up Snaefell, from Ramsey to the Bungalow. There are seven classes in either of these events, and the awards are for the best aggregate times on the two hills.

OCCASIONAL COMMENTS.

BY "IXION"

A Sporting Type of Hill-climb.

The average motor cycling hill-climb is shorn of much interest because each competitor ascends *solus* against the watch, instead of riding neck and neck simultaneously with a fellow competitor. There are several hills up and down the country where there is lots of room for two competitors to ride side by side. Clubs which hold events solely for sport could enjoy a very pleasant afternoon by running off a hill-climb in heats of two riders apiece on one of these comparatively straight hills, weeding out the heat winners until only two men were left to contest the final. If desired, the ordinary type of hill-climb might precede the side by side sprints, formula and fastest time prizes being first decided, and the riders being afterwards handicapped in so many seconds start for the neck and neck class, according to the performances registered in the solitary timed ascents. The advantage of this type of climb is that quite an easy hill will provide excellent sport, provided it is *straight and fairly broad*. Clubs that have already held climbs of the normal type up really stiff hills might organise a handicap neck and neck climb, basing their handicaps and starts on the records of their previous climb. It is a fine sight to see two riders flying up a gradient abreast at high speed.

Tyre Troubles in Big Trials.

From four years' experience of jointed detachable inner tubes I have good reason to know that there are tubes of this type on the market which are every whit as reliable as the endless tubes. For some time past the gentlemen who frame regulations for important trials have felt bound to leave an appreciable time margin over each control lest they should penalise the rider of a no-trouble machine for being afflicted by tyre troubles. I respectfully suggest that the days of that necessity are passed, since every rider can easily carry a stock of detachable tubes which will relieve him from the necessity of ever repairing a puncture by the roadside. I put a stop watch on a novice rider the other day when he was replacing a jointed tube after a puncture, and the time occupied from bringing his road wheels to rest until he restarted with a nice rotund tyre was 4m. 35s. If such a speedy replacement is within the power of a rider in his first year, it is within the power of those who compete in six-day trials, and consequently I think that organisers may safely commence to ignore the tyre factor in big trials and to frame their time regulations on a closer schedule. If a cover collapses hopelessly from wear in a week's ride the rider deserves

to be penalised for using it, and there should be no objection to any rider's repairing his punctured jointed tubes after the day's ride is over without penalty.

Standard and Special Machines.

I have a letter from a correspondent attacking myself and one or two others for our campaign against the

A SIX MILE HILL-CLIMB. A contour section of part of the mountain road which crosses Snaefell in the Isle of Man. This course has been selected by the Auto Cycle Union for the second hill-climbing competition to be held on the 24th inst., the day after the T.T. Race.

use of special machines in hill-climbs. He gives several instances of these speed models having been used with success in prolonged reliability trials, and says we "have been nicely shown up." On the contrary, I think recent events have rather justified the line certain contributors to this paper have adopted *re* these special machines. I will tackle his point first. It is true, certainly, that some hill-climb winning machines performed creditably in the Six Days' Trial. It is also true that if my correspondent had been in the yard of the Chequers at Uxbridge on a certain morning just before the start of the Six Days he would have seen one rider changing a pair of wheels and tyres; another inserting metal washers under the base of his cylinder, and slipping caps over his tappet heads, etc., etc. We want to bar from hill-climb practice all fakes which are not at the disposal of the private owner. Secondly, it is an open secret that several hill-climbing cracks have broken frames this season through rashly riding them too much on the open road. Thirdly, at Denholme Steep and Newnham, where racers and roadsters were separated, the times in the touring classes were very appreciably slower than the times in the racing classes; and amongst the prominent machines in the racing classes were several which had previously competed more or less regularly in "standard tourist" classes.

THE SIMMS MAGNETOS.

THE Simms Magneto Mfg. Co., Kimberley Road, Willesden, has probably had more experience with the ignition portion of the motor cycle's mechanism than any other firm in the British Isles, being associated with its production as early as 1902. For the last two years the firm has devoted itself entirely to the manufacture of magnetos and sparking plugs, and a visit to the Welbeck Works is one of absorbing interest. In the testing shop hundreds of magnetos are being run at 2,500 r.p.m. for a whole day, and for an hour or two the speed is accelerated to 4,000 or 5,000 r.p.m. Before testing, the machine has every part carefully gauged and examined for mechanical accuracy, and again after being run all day the process is repeated. Such delicate operations

as armature winding and condenser making require the greatest care and can only be performed by highly skilled workpeople, and as soon as these parts have left the hands of the operators they are separately tested. It is only by careful testing and supervision, and by a well-established plant, that successful magnetos can be made, and the Simms Co. not only exercises the former, but possesses the latter. The motor cycle magneto machine is known as the S.A. type, which is largely fitted to Triumph and other well-known motor bicycles. Since last described it has undergone no striking alterations, except that it is fitted with an improved oil cap and a new H.T. terminal, which is quite waterproof and remains unaffected even if the machine is soused with water from a puddle.

MOTOSACOCHE IMPROVEMENTS.

RIDERS of these excellent lightweights have from time to time experienced trouble through the belt hooks pulling through the round twisted belt, but through an ingenious arrangement, it is claimed, this small defect has been overcome by the aid of a steel combined hook and eyelet fixed to each end of the belt. In fig. 1 the device is shown ready to be placed in position. To fix it the end of the belt is untwisted slightly and folded double, the eyelet B is laid centrally along it, and the centre of the loop and of the hook are marked on the leather. Holes at F and D are then punched clean through both sides, and near the hole F another hole E is made. The hook is then inserted through the holes E and F, and the belt end is again folded over, when it will be found that the holes C and D correspond with the centre of the eyelet B. The hook A is then pushed through, and the pull is taken not on the leather alone, but also on the steel eyelet, thus render-

ing pulling through practically impossible. In fig. 2, representing the other end of the belt, the same procedure is followed, A being the hook and B₁ the eyelet. Motosacoché motor bicycles are now fitted as a standard with strong stands of a practical nature, which allow the back wheel to be removed with the stand *in situ*. A further improvement consists of the

FIG. 1.

FIG. 2.

introduction of spare oil and petrol tanks, which are merely light metal cylinders, which will fit into pump clips attached to the top tube of the machine. In them just sufficient petrol may be carried to last about twelve miles. The makers inform us that they have sold a large number of machines this year.

After the race for the Tourist Trophy. The hairpin bend at Ramsey, included in the A.C.U. six miles hill-climb up Snaefell on Friday afternoon next week. About a third of a mile higher up the hill, there is another acute bend, the "Goose-neck," almost as bad as the one depicted.

A MEET OF PASSENGER MOTOR CYCLES.

ON July 28th an enthusiastic motor cyclist, Mr. A. H. Millinger, "Helsby," Alcester Road, Moseley, Birmingham, addressed a letter to *The Motor Cycle*, and made the excellent suggestion that Midland owners of passenger motor cycles should meet at Stratford-on-Avon on August 7th and compare notes on the fitments of their respective mounts. This suggestion was warmly received by numerous readers, some of whom readily responded to Mr. Millinger's invitation. On the date mentioned thirteen owners of passenger vehicles foregathered at the Swan's Nest, Stratford-on-Avon, and, a photographer being present, we are able to pictorially represent on the next page some of the owners with their passengers and machines. For this courtesy we are indebted to Mr. Millinger, who has, in addition, provided us with brief particulars of each machine, and in some cases the owner's remarks on the merits of his mount are given.

Generally speaking, those who attended this meet were of the opinion that the rear tyre of a motor bicycle with sidecar attachment gave trouble at the beads, and that stronger tyres are wanted for this work. Belts were also troublesome in many cases. Several praised the Whittle link belt for passenger work, although it is only fair to mention that every make of belt was not represented at this meet. Of course, a change speed gear and free engine were voted a necessity for serious touring. Those without these adjuncts fitted to their machines found that motor cycling with a passenger was not exactly ideal. A similar meet will doubtless be arranged next year by one or other of the party, but it has been suggested that the hour of meeting should be fixed a little later than 3 p.m. to enable riders from a distance to have more time to reach the rendezvous.

Owners of passenger machines are asked to keep this meeting in mind for another year.

THE END-TO-END SIDECAR RECORD.

ON Monday of last week the Rex twin-cylinder motor bicycle and Millford sidecar which was successfully driven from John-o'-Groat's to Land's End in record time by the brothers Bentley was returned to Coventry for an examination of the seals we had placed upon the engine, frame, and sidecar, and these we found to be intact. The machine had been sent from Penzance to Coventry by rail, not because it was in an unfit condition to be driven by road, but on account of pressing business engagements which necessitated Messrs. Bentley's return to London by train immediately the ride was concluded.

We are pleased to record that both motor bicycle and sidecar were in good condition, and to prove

Stoneleigh Hill, which has a gradient of 1 in 8½ at the steepest part. About half the climb was accomplished on the top speed, only the steepest portion calling for a change of gear.

The Shamrock-Gloria tyres and belts stood the End-to-end test remarkably well—in fact, the tyres never punctured—but, owing to rain, which fell during half the journey, the belts required some amount of attention in the way of shortening. When one realises that the riders had three nights of eight hours' darkness each on the road the performance becomes much more significant. The Bentleys, who took it in turns to drive, reached Land's End at seven o'clock on the 2nd inst., and at 7.15 were on the way back to Penzance, and caught the 11.5 train to London. Next day they were attending to business.

From Douglas Bros., Kingswood, Bristol, comes a booklet of instructions published specially by the Bosch Magneto Co. on the management of the special magneto fitted to the Douglas twin-cylinder motor bicycle. As many readers know, this engine has horizontally opposed twin cylinders. The magneto is described as the DA1 two-cylinder (Douglas). A copy of the booklet will be sent free to any rider of a Douglas motor cycle upon receipt of card.

Practically every car driver carries an emergency spare tin of petrol nowadays as a permanent fixture on the car. This tin is seldom opened unless the tank starts a leak or through some unforeseen circumstance the car runs short of fuel. Under such conditions motor cyclists are usually dependent on others unless they have had the foresight to carry a small spare supply of petrol. A neat black enamelled cylindrical tank has now been introduced by Thos. Clayton and Son, Ltd., Birmingham, especially for the purpose. It is 12in. long by 2in. diameter, with a screwed filler cap at one end. Brass band clips encircle it for attachment to a convenient frame tube. With one of these emergency tanks fitted no rider need fear a broken petrol pipe, a leaking tank, or other cause of a fuel shortage.

At Land's End, the finishing point of the record ride by the brothers Bentley on a twin Rex and Millford sidecar. The End-to-end sidecar record seems to be almost as much coveted as the bicycle record, for hardly had the news of this ride been circulated than we were requested to seal another machine.

that the long journey from John-o'-Groat's to Land's End had not affected the pulling powers of the engine one of the Rex representatives took us a short ride in the neighbourhood of Coventry, and with twenty-four stones on board, the combination easily climbed

A MEET OF PASSENGER MOTOR CYCLES

J. P. Kemp, Handsworth. 6 h.p. water-cooled 1903 "Rex" tricar. Two-speed, chain drive. Dunlop tyres.

W. A. Millinger, Moseley. 5-6 h.p. "Rex-de-Luxe," with Roc adapted two-speed gear. Whittle belt. Continental and Dunlop tyres. Mills-Fulford fixed wheel sidecar.

W. E. Milns, Edgbaston. 3½ h.p. two-speed "Humber," with forecar. Whittle belt. Roc adapted clutch.

T. Tyson, Leicester. 3½-4 h.p. "Kerry," fan-cooled. Root and Clarke's two-speed epicyclic gear on extended engine shaft. Chain drive. Chater-Lea fittings. Mills-Fulford sidecar. Clincher A-Won tyres. Distance run 12,000 miles.

A. J. Lambert, Lydney, Gloucester. 2½ h.p. twin "Douglas," and rigid Chater-Lea sidecar. Only trouble belts pulling through.

G. Jones, Evesham. 7-9 h.p. "Bat." J.A.P. engine. Phelon and Moore two-speed gear (combined chain and belt drive). Continental Model-de-course tyres. Lomax detachable non-skid band.

G. F. Davies, Stourbridge. 1908 3½ h.p. "Triumph." Mills-Fulford fixed wheel sidecar. Single gear, 5½ to 1 R.O.M. back tyre. Rubber belt. Would like two speeds and free engine.

G. F. Chippendale, Birmingham. 3½ h.p. two-speed gear "Humber." Montgomery spring wheel coach-built sidecar. Whittle belt.

F. E. Lee, Stoke-on-Trent. 6 h.p. "N.S.U." Two-speed. Palmer Cord tyres. 11D. Whittle belt. Mills-Fulford Castor wheel sidecar. The celluloid wind screen greatly adds to the comfort of the passenger.

W. T. Rigby, Sutton Coldfield. 5-6 h.p. twin "Peugeot." Free engine and two speeds. Druid spring forks. Mills-Fulford Castor wheel sidecar. Whittle belt. Dunlop tyres.

QUESTIONS AND REPLIES

A selection of questions of general interest received from our readers and our replies thereto. When particular makes of machines, accessories, or tyres are mentioned, numbers must be used, the writer to keep a key for reference. All queries should be addressed to the Editor, "The Motor Cycle," 20, Tudor St. E.C., and whether intended for publication or not, must be accompanied by a stamped addressed envelope for reply.

Two Routes from Salisbury.

?

Kindly advise me which is the best route from Salisbury to Nottingham, and also from Salisbury to Bolton.—H.S.T.

Salisbury to Nottingham: Salisbury, Andover, Whitchurch, where turn left and go through Newbury, East Ilsley, Abingdon, Oxford, and Banbury. At the village of Princethorpe turn right for Rugby, Leicester, Loughborough, and Nottingham. Salisbury to Bolton: You had better follow the same route to Nottingham, and go on from there through Ripley, Matlock, Bakewell, Buxton, and Stockport, to Bolton.

Surface Carburetter causing Sluggish Starting.

?

I have a 3 h.p. Quadrant bicycle with carburetter inside tank. It is an old pattern, but compression is good, also spark at plug, but it is very hard to start. Have tried a new plug, cleaned contacts, charged accumulator, but there is still the same trouble in starting. Once going there is plenty of power.—L. F.

The trouble is probably due to the surface carburetter. At the present time the petrol sold is much heavier than when the machine was first designed. You can obtain .680 petrol by applying to your nearest agent, or direct from Carless, Capel, and Leonard, Hope Chemical Works, Hackney Wick.

Backfiring. Spring Forks.

?

(1.) I have a 3½ h.p. 1908 Minerva (accumulator) which has given me great satisfaction, but, should I run it on the stand and stop it, it kicks back and locks the chain. Of course, it has a band brake on rear wheel, and sometimes when above occurs it takes a bit of work to get it slackened again, and the rear wheel goes round with a snap. What is the cause and remedy? (2.) Kindly let me know what kind of springs for front forks would suit above machine?—R.W.

(1.) It would appear that you run the engine too long on the stand, and cause either the sparking plug points, some sharp projection in the engine, or particles of carbon to become red hot, with the result that the charge is pre-ignited and the explosion drives the engine backwards. A short circuit might cause the trouble. (2.) We should advise you to purchase the spring forks sold by the makers of your machine.

BIO

A Question of Gear Ratio.

?

I have a 1907 Triumph which fully laden weighs 210 lbs. This includes speedometer, pannier bags, large tool roll, tank full of petrol, oil, lamp, etc. My own weight in motor clothes is 162 lbs., making a total of 372 lbs. The gear at present is the standard one of 4½ to 1, and I find some difficulty in climbing several of the hills round here, frequently having to pedal. I don't think it is want of power, as I can get forty-five miles an hour on the level, and can go up a rise near here of half a mile long with a gradient something like, say, Ludgate Hill, at over thirty miles an hour, i.e., if I get a good rush at the

ENTRANTS FOR THE T.T. RACE.

J. L. Norton (Birmingham), 3½ h.p. Norton, 82 x 94 mm., B. and B. carburetter, magneto ignition, Dunlop tyres, Druid spring fork.

foot. Would you advise me to fit a 4in. pulley which would give a gear of approximately 5 to 1? Would this cause overheating on long level stretches keeping machine at legal limit, and would it mean much more wear to the engine and petrol and oil consumption? My present petrol consumption is 120 miles to the gallon. Further, I find it difficult at present to bring the machine down to ten miles an hour, and think a lower gear would help this.—H.S., Fife.

No, a 4in. pulley would not be too small, especially if you use a flexible belt. A 5 to 1 gear would not cause overheating, but we should strongly recommend you to fit an adjustable pulley. It is most useful, not only

for altering the gear, but for varying the tension of the belt. A lower gear naturally increases oil and petrol consumption, but not appreciably so.

Misfiring with Spark Lever Advanced.

?

I have a 1908 Rex Featherweight, which has taken lately to misfiring when spark lever is advanced more than about half-way. The compression is good, valve springs all right, carburetter quite clear, and plug all right. Can it be due to contact points of the magneto being too close? Kindly tell me the proper distance apart for them to be when current is breaking contact. At present I have difficulty to get thick paper between them.—S.F.

The trouble is probably due to you requiring a new fibre for contact breaker lever. First of all try adjusting the platinum points till they separate the correct distance recommended by the makers of the magneto. This is .5 mm. but the running is very little affected if the points break slightly less or more than this amount. We presume you have ascertained that the platinum points meet quite squarely, and the surfaces are clean. Also that magneto is correctly timed.

Underpowered for Sidecar Work.

?

I intend fitting a Montgomery sidecar to my 3 h.p. Triumph (1906), gear 5 to 1. (1.) Will this machine be powerful enough for touring in Derbyshire without much pedalling?—total weight twenty stones. (2.) Which type do you recommend for this machine, rigid, castor wheel or flexible? (3.) Are butt-ended tubes any more trouble than endless ones? Do they wear as long and would you carry one as a spare?—F.S.

(1.) We very much doubt if the machine will climb the hills in Derbyshire with sidecar and passenger unless a two-speed gear is fitted, and even then you would be demanding too much from your little engine. 3½ h.p. is the smallest engine we recommend for passenger work, even if a change speed gear is fitted. (2.) All types mentioned are satisfactory, and have their respective advantages. It is therefore, purely a matter of your own personal taste. (3.) Butt-ended tubes if properly fitted, give no trouble, and we certainly recommend you to carry one as a spare when touring.

Leslie C. Munro (Surbiton), 5½ h.p. Twin N.S.U., 85×84 mm., Bosch magneto, Continental tyres.

Route from Ealing to Derby.

I notice you recommend a route from Ealing to Derby via St. Albans, Luton, and Bedford. I am going to Derby, and propose taking the following route: Rickmansworth, Aylesbury, Buckingham, Towcester, Daventry, Lutterworth, Leicester, Loughborough, and Derby. Can you recommend this route? Are the roads good? Which is the more interesting.—C.C.T.

The route via Rickmansworth, Aylesbury, and Lutterworth is quite a good one, and is probably more interesting than through Luton and Bedford. On the other hand, the first-named route would probably be the faster of the two.

Slipping a Clutch to Aid in Hill-climbing.

Do you think a free engine clutch such as the Mabon would fit a 2½ h.p. Rex, and would it be of any practical assistance in climbing hills? I know the makers say it can be slipped a good deal, but I do not know if that in itself would help. Would it be quite reliable and would the extra weight of such fitment be too heavy for such a small engine? I can manage all ordinary hills with any machine as it is, but there are a few mountain passes in this district—miles long—which cannot be rushed, and I am unable to pedal hard enough to keep the engine speed up.—A. M., South Africa.

The clutch could be made to fit, and would be of assistance in climbing hills if eased slightly when the engine revolutions fall off. This enables the rider to pick up speed again. There is a considerable amount of overhang with a weighty clutch on a small engine-shaft, but it would not affect the running of your engine materially. If the mountain passes you mention are several miles long and very steep, you would not be able to slip the clutch definitely without causing considerable wear and friction. It would be better to get a more powerful machine if you cannot climb the passes without a lot of pedal assistance.

Misfiring and Overheating.

I have a 3 h.p. Singer, Bosch high-tension magneto, and Longuemare carburetter with a ten slot jet. It goes very well on about half throttle, but when I come to a hill and try to give it threequarters or full throttle it begins to misfire, and the misfiring gets worse as I close the extra air lever. The carburetter does not flood. The opening of the inlet valve (automatic) used to be more than ¼ in., but I strengthened the spring with a washer as the engine backfired into the inlet pipe and carburetter. The rocking arm in the magneto and the fibre ring are worn. Would this account for advancing and retarding the spark having little or no effect on the speed of the machine, about fifteen to twenty miles per hour? The spark always seems to me to occur at the top of the stroke, whether lever retarded or not, and I

Hugh Gibson (Southport), 3½ h.p. Triumph, 85×88 mm., Bosch magneto, Dunlop tyres.

have noticed that the engine begins to knock whenever I open the extra air inlet more than half-way. After a run of 100 miles a whitish deposit seems to settle on the magneto points, and then the engine misfires at slow speeds. Would carbon deposit cause the cylinder head to get red hot after running a mile or two fairly fast?—A. McINTOSH.

If the rocking arm and fibre ring in the magneto machine are worn they should be replaced without delay, and a great improvement in running will be noticed. The deposit on the platinum points is probably due to their burning, and this could be obviated by keeping the condenser connections clean. These are formed by the brass cap and the spring which holds it in position. The magneto machine would also be improved if magnets were remagnetised by the makers. Both ends of the spring should be kept bright. Excessive carbon deposit will sometimes cause the cylinder head to get red hot after running. You had better, therefore, have the cylinder taken off and the piston and cylinder thoroughly cleaned.

A Puzzling Case.

I ride a 1½ h.p. Wolf, accumulator, V belt, compression good, valves work well, ignition correct, accumulators fully charged, no signs of overheating, and I have been careful about lubrication. It starts easily, goes like a bird for about five miles, then slowly slackens pace to about eight miles an hour, and I cannot get any better pace out of it. It will run at this rate for miles, but no faster. Opening the throttle only makes the engine race, but the belt appears to grip all right.—DR. R. The trouble is one which is rather difficult to diagnose—possibly it is due to a partially choked carburetter. Opening the throttle cannot make the engine race unless the belt slips.

READERS' REPLIES.

Fouling of Sparking Plugs.

In answer to Frank H. Crimes, I would advise him to use Lodge plugs. I used to have the same trouble with my 1908 Rex, which has disappeared since fitting these plugs.—E. B. STAPLETON.

Misfiring in One Cylinder.

In *The Motor Cycle* for Aug. 25th I notice an enquiry from "W.O." re 5 h.p. twin Rex which will only start on front cylinder, and runs some distance before the back cylinder starts up. I had exactly the same trouble with my own twin Rex, and traced it to the induction pipe. The collar attaching pipe to rear cylinder had come unsoldered (the rear cylinder naturally gets hotter than the front), and this cylinder was consequently getting a very weak mixture. When the rear cylinder gets warmed up by the front one, or the engine speed increases, there is sufficient suction on the carburetter to overcome the air leakage through the broken joint, and the rear cylinder starts up.—CECIL H. DOBSON.

A. J. Moorhouse (Manchester), 5 h.p. Twin Rex, 77.5×79.375 mm., magneto ignition.

ON a long distance tour, when the rider would be at the furthest point a thousand miles from home, the preparations are naturally of a somewhat protracted nature. The first successful move was obtaining a month's holiday, and the next was to get an absolutely trustworthy machine. I had parted with my faithful 1908 Triumph just before Christmas, but was awaiting delivery of a 1909 model of the same make, promised by my agent, Mr. Eric Myers, for February 1st. It is advisable to be a member of a club for touring abroad, and, seeing that I required no legal advice or aid, etc., but simply touring information and facilities, I joined the C.T.C. A fortnight before starting I had my luggage forwarded to an hotel at Nice (my objective), there to await my arrival. Motor cyclists have been urged by one or two writers not to venture on a long tour with a machine they are not well acquainted with. My machine had only been delivered a fortnight, but I had no qualms in the Triumph—my fifth motor cycle. So it was with perfect confidence that I sallied forth on the 1st March from my home at Harrogate. I was bound for Southampton, and first made for Wetherby, where I was to join the Great North Road. Before reaching Wetherby I was delayed a minute or two by a slipping belt, caused by snow on the road. Afterwards an uneventful run through Doncaster, Bawtry, Newark, and Grantham brought me in time to Huntingdon—a distance of 140 miles from the start. Here I elected to stay the night, and was comfortably quartered at "The George." My new mount was in a very dirty state after the muddy roads I had encountered. Next morning I was occupied for half an hour in an endeavour to regain the Great North Road, eventually proceeding by way of Biggleswade and St. Albans. Here I branched off and got hopelessly mixed up in the by-lanes in trying to avoid London. Somehow I managed to reach Staines, and here I found the front wheel bearing rather "creaky." A cycle dealer removed the wheel and detached the bearing cups to find a quantity of liquid mud. New balls were fitted and the bearings regreased, etc., and I was again on the way, reaching Basingstoke in good time, and later arriving at Winchester.

Improvement in the Road Surface.

I experienced roads varying from slush to mud, then to frozen ruts, and now I was pleased to find them gradually improving all the way to Southampton, although in one part I had passed a number of young fellows tobogganning on a beautiful road, with pines on either side. I was soon threading my way through the busy streets

to the docks, from where I had to embark on the midnight boat to Havre. I was annoyed to find that I was forbidden to go on board or even to take my machine on until eight o'clock. It now began to snow heavily, so I wheeled my machine into the shelter, and then went and booked return passage for self (7s. 6d.) and machine (10s.), and also got some money changed.

The snow had almost ceased, and all was busy on the docks, as a ship from China had just arrived. Slowly the passengers filed down the gangway, representing all nationalities, from Chinese with their circular caps and pigtailed to the military man from India on leave, wearing his solar topee. Under the buzzing and flickering arc lamps, with the snow gently falling, the sight of these people—lascars and what not—looking after their voluminous luggage and speaking hurriedly in so many foreign tongues was impressive indeed.

At eight o'clock I fetched my machine, and the men were soon busy "slinging" it on board and lashing it firmly to the ship's side under the bridge.

Soon after midnight I heard a shuffling of feet and a cry of "All right aft." "Then let go forward," and in a few minutes we were steaming down Southampton Water. Seven hours later (Wednesday morning) found us at Havre with a regular unhealthy blizzard blowing, which was very disappointing to me, as I had looked forward to having perhaps some favorable weather. After getting a "permit" at a cost of sixty centimes (this, by the way, being the only formality I had to go through at the hands of the Customs, as I had got a Customs ticket from

The landing stage at Havre.

En route to the Riviera and Back by Motor Cycle.—

(C.), I wasted time in the vain hope of the weather clearing up. This it refused to do, so I was advised to go to Rouen, where it was *sure* to be better. I accepted this advice and booked second class for Rouen, which cost 6f. 25c. for myself and 2.25 for my machine. The train did not start till twelve, and I boarded the train after lunch. After a tiresome journey of about fifty miles I arrived at Rouen, putting up at the "Hotel de la Poste," which I found very comfortable.

Waiting for the Snow to clear.

The following day continued very snowy and slushy, and so were the next four days. I therefore visited various places of interest in Rouen, always keeping an anxious eye on the weather. On Sunday, the 7th March, proved to be a glorious day, so I took a walk a few miles along the road to

Auxerre. Women washing clothes by the banks of the river Yonne.

is for the purpose of inspecting the condition of the roads. As they were fairly satisfactory, I decided to start on the following day. Looking over my shoulder to see that all was in order, I noticed a small cut in the back tyre, a rubber non-skid. Next morning I started about nine o'clock, having previously filled up with a supply of petrol, which cost two shillings a gallon. It is no easy matter riding on the right-hand side of the road in the busy streets of Rouen, and was far from pleasant at first. Once outside Rouen, I was rather long time in reaching Vernon and Mantes, and then I found myself within a few miles of Paris. Stopping at a wayside shop to fill up with petrol, my machine was quickly surrounded by about a dozen testers who were testing cars from some works near Paris. The cute idea of turning the petrol injector to the compression tap soon caught their eye, and I had a busy time seeing that they did not fill my under head with petrol. One chap kindly found the nut and put it on my stand almost before I found the one was missing. Then came the inevitable questions—"What power?" "How fast can you go?"

"Where are you going to?" etc. The road approaching Paris began to get rather worse and very difficult to find. Passing through St. Germain, I was soon at Versailles. The cruel *pavé* was heart-breaking; the tremendous holes in the road gave me the worst half-hour I have had on a motor cycle. Nobody seemed to know the way without going through Paris and its awful *pavé*, but at last I found a driver of a small car, who put me on the right track. The road surface varied considerably, but improved towards Melun, where I spent the night, thankful for a fine day, and, considering the difficulty I had had in finding the road and time wasted in towns, I was quite satisfied with only knocking off 100 miles. Tuesday being a beautiful day and the roads in perfect condition, I made splendid progress through Montau, Sens, Joigny, and Auxerre, in places doing a good thirty miles an hour on a straight road mostly bordered with tall trees. I could easily hear the

peculiar "swish, swish" which I had heard of. Petrol I was lucky to get at 1s. 6d. a gallon—the cheapest so far.

A Succession of Tyre Troubles.

Soon after noon I felt my back rim bump heavily on some village setts, so I spent the next half-hour in mending my first puncture, caused by a sharp stone piercing the hole in the cover which I had previously noted. A few miles further on the same thing happened again, but this time in the country and on a lovely road, so, lazily lighting a cigarette, I sat down and surveyed my punctured tyre. Continuing my way a few miles, the back tyre burst with a deafening "bang." More rest, more cigarettes, more work, and then I was off again, but this time riding very carefully. Soon it appeared as if I was in for a real bit of climbing at last, so, driving with throttle nearly closed, I injected

a pumpful of Price's A. and slowly approached a cliff which almost rose sheer up from the end of the road. My excitement grew as I got nearer and nearer, so, kicking the cut-out open, I made a dash forward, prepared for anything, and got the surprise of my life. I had landed into a tunnel, with just a speck of light appearing in the distance and no lamps. My exhaust was making a tremendous din, so, closing it, I had a look down for my levers, and could not even see my handle-bars, let alone the sides of the tunnel and the surface of the road! It was decidedly weird, and not a little startling at first. To unexpectedly meet a 60 h.p. car half-way through would most decidedly result in a nervous breakdown for the lot of us. Unfortunately, I had no lamp on my machine.

(To be continued.)

The Lancashire Motor Exchange are making a speciality of supplying motor cycles for export to the colonies. Full particulars will be sent by the firm, whose address is Lancaster Road, Morecambe.

Death of the Founder of the Quadrant.

We sincerely regret to have to record the death of Mr. Wm. Priest, which took place at his residence, Hampton-in-Arden, Warwickshire, on Monday of last week. Mr. Priest was the senior partner in the Quadrant Motor Co., Earlsdon, Coventry, and many years ago founded the business of the Quadrant Cycle Co., Birmingham, which grew to large proportions. The deceased gentleman was one of the first to recognise the possibilities of the motor cycle, and the Quadrant was one of the first all British built machines which met with success. Mr. Priest was very well known in Midland business circles, and was at one time president of the Cycle Manufacturers' Trade Protection Association. When the Quadrant Cycle Co., Birmingham, met with reverses Mr. Priest, in conjunction with two of his sons and Mr. T. Silver, commenced the manufacture of the Quadrant motor cycles at Earlsdon, Coventry, under the title of the Quadrant Motor Co. We offer our sincere condolences to the family in their bereavement.

Great Orme's Head climbed on a Motor Bicycle.

As long ago as 1904 J. Edge, Liverpool, climbed Great Orme's Head, Llandudno, on a Bat pedalless motor bicycle, but as far as we are aware until lately no motor cyclist has accomplished Edge's feat. J. C. Bennett Mitchell, Leeds, recently made two ascents on a 3½ h.p. Bradbury, from which the pedals had been removed—one by way of the Tygwin Road, which we are told includes a stretch of 1 in 3½, and the other by way of a new road from the Marine Drive, which has two very sharp hairpin bends. The second half of the ascent has to be *viâ* an old quarry road deeply rutted and of rough boulder-strewn surface.

Petrol Imports.

7,627,242 gallons of petroleum spirit were imported last month, duty having been paid on 2,694,562 gallons. From the 30th April to the 31st August duty has been paid on 10,402,358 gallons of petrol.

Imports of Motor Cycles.

Last month's imports of motor cycles and parts show a slight improvement over August last year, the figures being £5,541 and £4,417, respectively. During the eight months ended 31st August, the import figures were:

	1907.	1908.	1909.
Motor cycles—			
£42,189	£30,958	£29,891	
Parts thereof—			
£22,592	£17,441	£19,387	
Total value—			
£64,781	£48,599	£49,278	

Exports still Increasing.

The value of last month's exports of British motor cycles and parts is more than double the figures for the corresponding month of 1908, viz., £9,054, as compared with £3,906. During the eight months ended 31st August, British motor cycle exports are represented by the following figures:

	1907.	1908.	1909.
Number of complete motor cycles exported—	462	556	856
Value—			
£16,093	£19,053	£30,517	
Parts thereof			
£19,482	£13,652	£21,637	
Total value—			
£35,575	£32,705	£52,154	

Re-exports.

Re-exports of foreign made motor cycles and parts from this country have reached a value of £17,513 during the eight complete months of the present year. The 1908 figures for the same period were £7,608, and 1907 £3,990.

A New Method of Timing.

A movement to put an end to the objections regarding checkers' watches reported to be inaccurate, in reliability trials against time, and also complaints regarding many riders training over known courses, has been introduced by the Bradford M.C.C., and will be tried in two long-distance runs down for decision this month. At the start of each run all competitors' watches will be sealed and times will be taken from them by checkers *en route*. If any rider declares his watch to have gone wrong, the time will be taken from the checker's watch.

Moreover, the course will not divulged until time of starting, while each rider's schedule with times worked out will be handed to him.

Police Traps.

A measured furlong from Lewish Workhouse, on the road to Catford

There is a trap at Northwood Middlesex, by the railway bridge approached by a dip on either side.

Another slightly nearer Harrogate possibly worked only at week-ends.

There is a measured quarter of a mile on the open road two miles from Arundel, on the road to Worthing to the east. There are rumours that the trap is shifted from time to time, and works occasionally on both sides of Arundel.

The police trap referred to on the Norwich-Fakenham road in our issue of the 1st inst. apparently lacks confirmation, as we have heard on good authority that the Norfolk police are not trapping in the open road, where no danger exists.

Between Sheffield and Huntingdon motor cyclists are recommended to drive carefully at Wickersley, Bramley, and to exercise great caution in passing through Retford, where the ten mile speed limit is enforced. There is also an occasional trap from South Muskham to Newark, while the Lincoln Bennington to Great Gonerby, Ponton to Colsterworth traps are continuously working. The latter traps are worked very fairly, and a certain mileage over the legal limit is generally allowed. In Colsterworth itself there is a ten mile speed limit and a trap is occasionally worked in the village. There are occasional traps at Stilton and Stukeley, while the police are active in the villages of Alconbury, Buckden, and Fenstanton.

At the summit of Great Orme's Head, Llandudno.
J. C. B. Mitchell and his 1909 Bradbury.

One of the private owners in the T.T. Race.
A.V. Blake (Larne, Co. Antrim), 3½ h.p. Triumph
84×86 mm.

Police Traps (continued).

Several motor cyclists were stopped by the police in Sussex to have their licences examined last week. This happened near Ashdown Forest and in other parts of the county, but we have reason to believe that this was merely a general examination of licences, and no fines were taken.

A 220 yards trap half a mile beyond Woodford on the Epping Road. Plain clothes officers hide behind the hedge on the right. Any motorist exceeding twenty miles per hour is stopped.

Caithness, Contour, Route 322, Thurso to John-o'-Groat's, from Castle-town to Dunnet, about three miles over Dunnet Links. Route 325, Thurso to Westerdale, movable trap one mile long between Thurso and Halkirk. Trap from Westerdale to Halkirk four or five miles.

The Pneumatic Tyre Majority Celebration.

On the opening day of the Stanley Show a banquet and presentation, in the form of a suitably inscribed silver basket, will be made to Mr. Harvey On Cros, J.P., as some little recognition of the unique services rendered to the cycle and motor industries.

The British Motor Cycle Racing Club.

Owing to the T.T. Race in the Isle of Man taking place on the 23rd inst., it has been considered advisable to postpone the date of the sixth members' meeting, originally fixed for September 15th, until Wednesday, September 29th.

The State of Chatham Hill.

A correspondent wishes to warn readers of the very bad state of the road on Chatham Hill. Riders ascending should keep strictly to the left, but when descending take the centre of the tram track. He adds that cycling accidents are alarmingly frequent.

Open Hill-climb on Amulree.

The Edinburgh M.C.C. has decided to hold an open hill-climb on Amulree on October 9th. It will be remembered that this ascent was included in the Scottish Five Days' Trials, and proved a stumbling block to nearly all. Every conceivable make of motor cycle has been catered for to attract a large entry, ten classes having been included. The trials hon. secretary is P. E. Tolfree, 17, Falcon Avenue, Edinburgh.

The Rule of the Road.

With so many competitors in the Tourist Trophy Race, it behoves one and all to adhere carefully to the rule of the road both in practice and during the race. By so doing accidents may be prevented. We are led to publish this reminder, as we notice there are quite a number of riders new to competition and speed work among the entrants. The danger of accidents is always greater as the speed gets higher.

The Western District M.C. Hill-climb.

We are asked to point out that the particulars circulated among the members for the above event mentioned that in filling up the entry form it was necessary to state whether a variable gear was fitted or not; therefore it was contemplated that variable gears

would be used in some or all of the classes. The riders of the Zenith Gradua machines stated on their entry forms that their machines were fitted with variable gears, but it was not until just before the start of the event that they were informed that they could only compete in a separate variable gear class or in the racing class, and this only on condition that they used one gear all the way up the hill. They declined to accept these conditions, and withdrew from the contest. In the report of the hill-

H. Reed, winner of the Twin-cylinder Trophy in last year's T.T. Race. This year he will ride a 5 h.p. Twin Dot-Peugeot, 75 x 75 mm., a.o.i.v., Amac carburetter, and magneto ignition.

climb in the "Club News" pages of September 1st, it was stated that the Zenith Graduas were barred in the competition. Later information, however, proves they were only barred in the single-cylinder touring class, but their riders naturally declined to compete in any other class if they could not use the variable gear with which the machine is provided as a standard fitment.

Are Special Motor Roads Wanted?

The Road Improvement Bill was fully discussed by the R.A.C. and its associated bodies on the 3rd inst., and the following resolution was unanimously passed: "That the General Committee of the Royal Automobile Club and Associated Clubs expresses its satisfaction with the Development and Road Improvement Funds Bill, Part II., and further expresses the hope that the attention of the Road Board will be specially given to the improvement and widening of existing roads for facilitating motor traffic rather than to the construction of special motor roads."

Tourist Trophy Trifles.

Some of the competitors have left their practising very late. We know of one or two entrants who were not expecting delivery of their machines until the end of this week.

Anent the leaderette in the issue of the 1st inst. relating to wear of cylinders during the race, we note that several of the twin-cylinder machines are only 1 cubic centimetre short of the limit. Truly this is cutting it fine. It means that if both the cylinders have worn a hair's-breadth by the end of the race, the capacity of the engine will exceed the limit.

The total number of entries received for the race is fifty-nine. In allotting the numbers, the fateful 13 has been omitted. Of the fifty-nine entrants, twenty-four are private owners of the machines they will ride. Single-cylinder motor bicycles number thirty-two, twins twenty-six, and four-cylinder one.

The fact that so many riders of single-cylinder machines have entered goes to show that they fancy their chances against the multi-cylinders of greater power, and it would be impossible to forecast the result with accuracy.

Giuppone will use one of the new pattern 84 x 86 mm. single-cylinder Peugeot engines, with overhead mechanically-operated inlet valve.

Practising on the course commenced last Thursday. Competitors are allowed to practise up to 8 a.m., except on Sundays.

America is represented in the race by three Indian machines—two twins and a single of 82½ x 93 mm. (to be ridden by G. L. Fletcher), which is new to this country.

Snaefell, the venue of the climb on Friday afternoon next week, is generally regarded as the most severe test to which motor cycles have yet been put, excepting, perhaps, the French Mont Ventoux hill-climb. We heard a car owner last week offering to wager that no single-gear motor bicycle could climb Snaefell. We should not like to make so sweeping a statement.

S. C. Perryman and B. V. Jones are using Simms magnetos on their twin-cylinder machines, not Bosch as stated in last week's issue. It was expected that a new twin Norton engine with overhead mechanically-operated inlet valves would be ready in time for the race, but Mr. Perryman has now decided to revert to his 75 x 84 mm. a.o.i.v. twin.

In next week's issue we shall publish the entries for the hill-climbing competitions on Kewagie and Snaefell.

FUTURE EVENTS.

- Sept. 23—THE TOURIST TROPHY RACE FOR MOTOR CYCLES IN THE ISLE OF MAN.
- " 24—Hill-climb on Kewagie Hill, Isle of Man. Five classes. Start 10 a.m.
- " 24—Hill-climb up Snaefell. Start 2.30 p.m.
- " 29—British M.C.R.C. Sixth Members' Meeting at Brooklands.
- Oct. 6—Race meeting at Brooklands (two events for motor cycles).
- " 11—Two Hours Record Race at Brooklands, organised by the British M.C.R.C.
- " 9—Edinburgh Motor Cycling Club Open Hill-climb on Amulree.
- " 10—A.C.U. Fourth Quarterly Trial of 1909, Uxbridge to Banbury and back.
- " 16—Motor Cycling Club Private Race Meeting and Gymkhana on Brooklands track.
- " 23—Motor Cycling Club closing run of the year to Brighton.

THE INTERNATIONAL TOURIST TROPHY RACE.

Officials.

THE following gentlemen have been selected to act as officials in connection with the forthcoming race and hill-climbing competitions in the Isle of Man on September 23rd:

Judges.—Messrs. J. W. G. Brooker, H. G. Cove, Victor Hart, J. W. Orde, Robert Todd, and Archibald Sharp.

Chief Marshals.—Messrs. F. C. Baisley, J. R. Nisbet, R. D. F. Paul, and J. K. Starley.

Marshals.—Messrs. H. P. Beasley, H. G. Bell, E. M. P. Boileau, R. S. Brooke-Hitching, S. W. Carty, D. K. Hall, J. Haslam, Dr. H. R. Mayo, A. E. Newton, S. W. Phillpot, H. C. Pickering, W. Pratt, C. E. Rackham, A. J. Wilson, and the members of the Manx Automobile Club.

Press Steward.—Mr. F. A. Hardy.

Timekeepers.—Messrs. A. V. Ebbelwhite, C. P. Glazebrook, and A. Geo. Reynolds (official timekeepers Auto Cycle Union and Royal Automobile Club).

Clerk of the Scales.—Mr. B. H. Davies.

Time Auditors.—Messrs. J. Baynes, R. A. Tyler, A.C.A., and F. Little.

Secretary.—F. Straight, 18, Down Street, Piccadilly, London, W.

The T.T. Race Fund.

The above fund has now reached the sum of £67 16s., made up as follows:

Amounts previously acknowledged in <i>The Motor Cycle</i>		
G. M. Mackay	...	£59 8 0
Vanguard	...	0 2 0
Five Stourbridge Triumph riders (per R. T. Davis)	...	0 3 6
	...	0 12 6

Hunter Bros. (Clapham)	0 10 0
Leslie C. Munro	0 5 0
Robert Clayton	0 2 0
E. B. Hall	0 5 0
Norman Hughes	0 3 0
J. K. Starley	1 1 0
Indian Motorcycles	3 3 0
F. S. Barnwell	1 1 0
Miss Muriel Hind	1 0 0
Total	£67 16 0

The expense of holding the race this year is much greater than last, principally because the R.A.C. is not organising a motor car race in the Isle of Man; therefore all the cost falls on the shoulders of the A.C.U., which feels justified in asking motor cyclists to assist. The cash prizes amount to £82 7s. alone. Donations, however small, will be welcomed, and collecting sheets can be obtained from the secretary, 18, Down Street, Piccadilly, W., or *The Motor Cycle* Offices, 20, Tudor Street, E.C., and Coventry.

For every £1 up to £100 contributed to the fund *The Motor Cycle* will give 1s. Cheques, postal orders, etc., should be made payable to the Auto Cycle Union, and may be addressed to the Club or the Editor of this journal as above. All contributions will be acknowledged in *The Motor Cycle*.

A Late Entry.

We have received notification from the A.C.U. that an additional entry for the T.T. Race has been received. This was after the list on page 686 had gone to press. The entrant is a private owner named A. West, and he will ride a 3½ h.p. Triumph, 85 × 88 mm., cylinder capacity 499 c.c.

M.C.C. RACE MEETING & GYMKHANA AT BROOKLANDS.

LAST week we inserted a paragraph respecting the Motor Cycling Club holding a gymkhana meeting in Mr. DuCros's park. The idea has grown, and the club has now decided to make this event quite a new departure, and turn it into a private race meeting and gymkhana at Brooklands Track on Saturday, October 16th, commencing at 12 o'clock (noon). All members will be catered for, especially the ordinary rider on the every-day motor cycle who has never before had the luck to get a chance of a run on the track.

Preliminary Programme.

1. MOTOR CYCLE HANDICAP RACE. Two laps of the track (about 5½ miles). For riders who have never ridden in a race at Brooklands. Engines not exceeding 500 c.c. Entrance fee, 2s. 6d.

2. MOTOR CYCLE HANDICAP RACE. Same conditions, but for engines between 344 c.c. and 1,000 c.c. Entrance fee, 2s. 6d.

3. MOTOR CYCLE HANDICAP RACE. Open to all of the members. Engines up to 1,000 c.c. Distance, three laps (about 8¼ miles). Entrance fee, 2s. 6d.

4. CAR HANDICAP RACE. For drivers who have never raced at Brooklands. Three laps of the track. Entrance fee, 2s. 6d.

5. MOTOR CYCLE "CIRCLE" RACE. Gymkhana event. Entrance fee, 1s.

6. MOTOR CYCLE "LIFE BELT" RACE. A gymkhana event. Entrance fee, 1s.

7. MOTOR CYCLE "TORTOISE" RACE. A gymkhana event. Entrance fee, 1s.

8. CAR "ENGINE STARTING" RACE. Gymkhana event. Entrance fee, 1s.

9. CAR "BENDING" RACE. Gymkhana event. Entrance fee, 1s.

10. CAR "TORTOISE" RACE. Gymkhana event. Entrance fee, 1s.

The handicap will be decided on the system of a preliminary run round the track, and any increase in speed in excess of five per cent. will disqualify.

Only members of the club can enter the competitions, but members can introduce as many friends to the track as they wish, and, at a later date, tickets will be supplied on demand.

After October 1st the club is willing to elect new members, their first subscription carrying them on to the end of 1910. This, therefore, is an advantageous time to join the club, as new members will not only get fifteen months' membership for one year's subscription, but can also take the opportunity of participating in this event at Brooklands. Full notices will be sent to all members through the post.

For this event only Mr. S. H. Fry is acting as trials hon. secretary.

On October 4th Messrs. Phelon and Moore will open their new London premises at 11-12, Mortimer Street, W.

DUBLIN & DISTRICT M.C.C.

RACING AT PORTMARNOCK.

The above club brought the year's competitions to a conclusion on Saturday last with a race meeting on the Velvet strand at Portmarnock. Three events made up the programme, and in each of these F. J. Walker, on a twin-cylindered 5 h.p. Rex, was the scratch man. Walker was very successful, winning two of the three events, and the third was won by T. J. Dunphy, on a J.A.P. The handicapping, which was done by the club committee, was very satisfactory.

DETAILS.

Two miles handicap (out and home).—T. J. Dunphy, 3½ h.p. J.A.P., 15s. start, 1; J. Healy, 5 h.p. twin Peugeot, 0s., 2; R. H. Taaffe, 5 h.p. twin Peugeot, 5s., 3. Won by s., 14s. between second and third. Winner's nett time, 1m. 13s.

Four Miles Handicap.—F. J. Walker, 5 h.p. twin Rex, 1; M. J. Chambers, 2½ h.p. F.N., 100s., 2. Won easily. Winner's nett time, 5m. 49s.

Ten Miles Handicap.—F. J. Walker, 5 h.p. twin Rex, 1; R. Walsh, 2½ h.p. J.A.P., 140, 2; R. H. Taaffe, 5 h.p. twin Peugeot, 30s., 3. Winner's nett time, 15m. 19s.

Back markers in the Ten Miles Handicap of the Dublin and District M.C.C. races at Portmarnock Velvet Strand.

MURATTI TROPHY RELIABILITY TRIALS.

The committee of the Ulster Centre M.C.U.I. held a further meeting on the 10th inst. to consider the result of above trials. At the finish of the competition on August 31st, C. E. Murphy reported to the hon. secretary that he had been marked 1½m. wrong at the Banbridge control, and the timekeeper was asked to attend the meeting in order to give some information. He (the timekeeper) explained that he set his watch by the Post Office clock, but it transpired that one of the P.O. lady clerks informed him afterwards that the clock was 1½ to 2 minutes fast on the morning of August 31st,

which was exactly the difference between the watches Murphy carried and the time marked on his check books. However, the committee decided to adhere to the times recorded in the check books. It was also decided to deduct one mark for each full minute a competitor was early or late. The riders were finally placed as follows: 1, J. Stewart (3½ Triumph), 160 marks, Muratti Trophy (won outright) and gold medal; 2nd, C. E. Murphy (3½ Triumph), 159 marks, gold medal; 3rd, O. C. Godfrey (3½ Rex), 156 marks, gold medal; 4th, J. Coulter (3½ Triumph), 145 marks, silver medal.

CLUB NEWS

Barnsley and District M.C.C.

The following are the results of the Barnsley and District H.P. x T L.C.C. hill-climb, worked out on the formula
$$\frac{W}{H.P. = \frac{D^2 \times \sqrt{S \times N}}{18000}}$$
 Horse-power was calculated on the Coventry and Warwickshire M.C. formula, which is—

Formula.		Time.
1. E. Slater (3½ h.p. Triumph)	...	42½s.
2. J. Haslam (2½ h.p. J.A.P.)	...	54½s.
3. T. W. B. Durant (3½ h.p. Durant-J.A.P.)	...	45½s.
4. F. Scorch (3½ h.p. Triumph)	...	49s.
5. E. H. Longley (3½ h.p. Peugeot)	...	51½s.
6. F. Greenwood (5 h.p. Rex)	...	40½s.
7. J. Oxley (2¾ h.p. Douglas)	...	58s.
8. T. Dunk (5 h.p. Rex)	...	39½s.

Richmond and District M.C.

The annual reliability trial (motor cycle section) for the Harpmael Challenge Cup took place on the 5th inst., and the holder of the cup, F. C. Wood (who only wanted one more win to make it his own) was again the winner. The run was from Surbiton to Winchester and return, a distance of 110 miles, and in the event of more than one competitor making a non-stop run the cup was to be awarded to the one who adhered nearest to his stated schedule speed. Secret time checks were made at various places. The entry was very good, and included two new machines which will compete in the Tourist Trophy Race. The following members made non-stop runs:

Difference from Schedule.	
1. F. C. Wood (3½ h.p. N.S.U.), winner	6m. 43s.
2. C. Dibben (3½ h.p. Triumph)	9m. 50s.
3. Dr. Brewerton (12 h.p. Lagonda)	10m. 9s.
4. J. S. Spring (3½ h.p. Triumph)	10m. 53s.

In addition to the cup, the club awards a medal to each competitor who made a non-stop run.

Brighton and District M.C.C.

The undersigned team of three challenge any other team or teams of three members of the above club to a reliability run

to Hartfield and back on the 26th inst., start from headquarters 10.30 a.m.: Messrs. C. Smith, J. Best, and R. Wilkins. Particulars and conditions of the run will be found on the club notice board, the losing team to pay 1s. per member into the club's prize fund.

Hull and East Riding A.C.C.

Dr. W. H. Coates (president) has kindly invited the members of the above club to tea at Bleak House, Patrington, on Saturday next, the 18th inst.

A pace-judging competition has been arranged to be held on the journey to Patrington, starting from Martfleet tram terminus at 2.30 p.m.

The judges' report in connection with the High Hunsley hill-climb is now to hand, and reads as follows:

CLASS I. (UP TO 76 x 76 MM.).

	Fig. of merit.
1. W. Crawford (2 h.p. Minerva)	8.910
2. Mrs. Thomlinson (2½ h.p. J.A.P.-Kestrel)	7.376

CLASS II. (1905, OR EARLIER MAKE).

1. W. Crawford (2 h.p. Minerva)	8.778
2. S. Missin (65 x 72 Rex)	7.732
3. W. Pannell (77 x 77 Singer)	6.092

CLASS III. (SINGLE-CYLINDER, ANY SIZE).

1. Mrs. Thomlinson (2½ h.p. J.A.P.-Kestrel)	7.313
2. R. Pearson (3½ h.p. Triumph)	7.278
3. G. Bosville (3½ h.p. Triumph)	7.039
4. G. Mumbv (3½ h.p. Triumph)	6.610
5. R. N. Pilling (3½ h.p. Triumph)	6.449
6. F. Mallison (3½ h.p. Bradbury)	5.713

CLASS IV. (TWIN-CYLINDERS).

1. A. Evans (5 h.p. V.S.)	5.764
2. A. W. Raynor (5 h.p. Rex)	4.948
3. A. Willis (5 h.p. Rex)	4.778
4. J. McDougall (6 h.p. Sarolea)	4.338

CLASS V. (PASSENGER MACHINES).

1. W. Crawford (6 h.p. Sarolea)	8.641
2. R. Akester (4½ h.p. J.A.P.-Rover)	7.777
3. A. H. Walker (5 h.p. Rex)	7.427
4. A. Evans (5 h.p. V.S. and sidecar)	6.685
5. J. McDougall (6 h.p. Sarolea and sidecar)	6.093

Club News.—

Hertfordshire County A.C.

A hill-climbing competition (handicap) is to be held at Aston Hill, on Saturday, the 25th inst. Class I. is for motor bicycles, entry fee 3s. 6d., which must be sent in by Friday next.

Manchester M.C.

The Manchester Motor Club held a hill-climbing competition on Saturday, the 4th inst., which was the last it will organise this year. There was a capital entry of motor cycles and cars. The weather, however, was very unfavourable, which has, unfortunately, been the case for most of the club events during 1909. There were two motor cycle classes for machines with single and multi-cylinder engines. The results on club formulae are as follow:

H.P. \times T

Where h.p. = horse-power, T = time in seconds,

W

W = combined weight. H.P. calculated as follows:

$D^2 \times S \times N$

Where D = diameter in mm., S = stroke in mm., N = number of cylinders. Results:

Class 1.—1, A. J. Moorhouse ($3\frac{1}{2}$ h.p. T.T. Triumph); 2, C. E. Kettle ($3\frac{1}{2}$ h.p. Triumph).

Class 2.—1, D. Thomas (5 h.p. Peugeot); 2, H. J. Scale (6 h.p. Antoine).

Class 1 (Novice).—1, E. Jones ($3\frac{1}{2}$ h.p. Premier); Class 2, F. W. Sixsmith (7 h.p. Matchless).

A. J. Moorhouse made the fastest time of the day.

In the forthcoming T.T. race the club will be represented by four members, viz., P. Butler, W. Heaton, A. J. Moorhouse, and Harry Reed (holder of the twin-cylinder trophy).

Essex M.C.

The annual gymkhana takes place on Saturday next, the 18th inst., the venue being the Essex track, High Beech, near Loughton, in the middle of one of the most picturesque portions of Epping Forest. The competitions are timed to begin at 3.30 p.m. and a highly interesting programme has been arranged. Full particulars may be obtained of the hon. sec., Mr. Harold Fuller, Wyndale Road, Woodford. Ladies are particularly invited to be present. Tea will be served during the progress of the sports.

Coventry and Warwickshire M.C.

The Thames Valley run on Saturday and Sunday last was quite as successful as the weather conditions allowed. Nineteen members and friends on motor cycles and cars left Coventry at 1.15 p.m. for Oxford, Henley-on-Thames, and Maidenhead. Doubtless if definite arrangements could have been made with the clerk of the weather, the muster would have been larger. At the start the clouds looked threatening but after Banbury the weather was beautiful, and remained so until the completion of the run. The headquarters at Maidenhead were the New Thames, where everyone was made thoroughly welcome. On Sunday the launch, *Lady Constance*, chartered by the club, went upstream *via* Boulter's Lock, which was, of course, crowded. The return journey was *via* Reading, Pangbourne, and Shillingford. The section of the Bath Road from Maidenhead to Reading cannot be recommended; it is not only uninteresting, but has an atrociously "pot-hole" surface. The fine scenery of the Thames Valley from Pangbourne to Shillingford was, however, some compensation for this poorly mended piece of road. Mr. A. P. Smith, the assistant hon. secretary, is to be congratulated on the success of the run, which would have been certainly more largely attended had the weather been more settled on the Saturday.

The Manchester Motor Club's competitions are always well organised and supported. Our picture shows a competitor, W. Manock (7 h.p. Peugeot), ready to start in the last members' hill-climb of the year. In this event, fastest time of the day was accomplished by A. J. Moorhouse ($3\frac{1}{2}$ h.p. T.T. Triumph).

Club News.—

Wimbledon and District M.C.

The result of the above club's hill-climb is: 1, A. Warrington (4½ h.p. Minerva); 2, W. R. Wacher (3½ h.p. Triumph); 3, F. Winters (4½ h.p. Minerva). The reliability trial will be held at an early date.

Alderdeen and District M.C.C.

The club held a hill-climbing competition on the 4th inst. at the Cairn-o'-Mount. The climb was from the Bridge of Dye to the summit, and was undoubtedly the most severe test of the year. The fastest time was made by P. Bischoff on a 3½ h.p. T.T. Triumph, the second being J. Bruce, also on a 3½ h.p. T.T. Triumph.

Motor Cycling Club.

In the petrol consumption trial on the 4th inst. only one award has been made in Class 1 for single-cylinder machines, W. A. Jacobs (3½ h.p. Rex), who takes a gold medal. The gold medal in Class 2, for multi-cylinder engines, goes to R. C. Davis (5 h.p. Griffon); silver medal, J. V. Robinson (2¾ h.p. Douglas); bronze medal, G. L. Fletcher (2¾ h.p. Douglas).

Potential members of the Motor Cycling Club need not wait until early next year to join. Applications for 1910 membership may be sent in on or after October 1st, and if accepted the new members will be able to take advantage of the club's winter programme, including the annual dinner.

Newcastle and District M.C.

A hill-climb was held near Rothbury on the 5th inst., and a very large muster of members and friends attended. There was a good entry, and the competition was run off in three classes—passenger vehicles, single-cylinder motor bicycles, and twin-cylinder motor bicycles. The following awards were made, based on A.C.U. formula, and gold medals were awarded for fastest time in each class:

Passenger vehicles.—Fastest time, R. Wilson (6 h.p. N.S.U. and sidecar).

Single-cylinder motor bicycles.—Fastest time, R. Ellis (3½ h.p. Rex Speed King).

Twin-cylinder motor bicycles.—Fastest time, G. W. Raper (6 h.p. N.S.U.).

Passenger vehicles.—R. Wilson and E. L. Bates.

Twin-cylinder machines.—R. Crosier (2½ h.p. N.S.U.), 246; P. Roberts (4½ h.p. F.N.), 283.1; G. W. Raper (6 h.p. N.S.U.), 392.7.

Single-cylinder machines.—R. B. Smith (4 h.p. N.S.U.), 178.6; R. Ellis (3½ h.p. T.T. Rex), 265.2; R. L. Keene (3½ h.p. Triumph), 277.6.

Worcestershire M.C.C.

The recent reliability trial for the President's Cup was run over a distance of about 160 miles, the course being from Bromsgrove to Rhayader and back. Secret controls were arranged *en route*, and a time limit not exceeding twenty miles per hour and not less than eighteen miles per hour was fixed. A competitor arriving at controls before or after the specified time was penalised 1 mark per minute.

The competitors were: L. T. Baylis (3½ h.p. Corah), non-stop; G. R. A. Deacon (3½ h.p. Rex), non-stop; H. B. Denley (3½ h.p. Minerva), non-stop; H. J. Folkes (3½ h.p. Triumph), non-stop; H. C. Pickering (2½ h.p. Rex), non-stop; F. H. Southam (3½ h.p. Triumph), non-stop; T. Smith (3½ h.p. Rex), non-stop; W. E. Ward (3½ h.p. Triumph),

non-stop; R. T. Wood (3½ h.p. Triumph), non-stop; E. Burgess (5 h.p. Rex), retired to assist Mr. Pollock; H. T. Clarke (3½ h.p. Humber), puncture; T. W. Deakin (5 h.p. Rex), puncture; B. Potter (7.9 h.p. Elite), puncture; N. C. Pollock (5 h.p. Rex), tyre burst and left rim, retired; L. F. Parkes (7 h.p. Mist), belt jumped off pulleys, delayed 3m.; and G. Sanders (3½ h.p. G.S.), sooted plugs, delayed 4m.

Sutton Colfield A.C.

The annual reliability trial takes place on the 25th inst., commencing at 2.15 p.m. The course chosen is a circular one of about twenty-one miles (to be covered five times), starting from Sutton, thence to Lichfield, and passing through Tamworth, where there will be a control. There will be a tea interval of forty-five minutes' duration at the Castle Hotel, Tamworth, where petrol tanks may be replenished, but no adjustments to the machine will be permitted. The competitor making a non-stop run and riding nearest to schedule will be declared the winner. Valuable prizes are offered, including a silver challenge cup, to be won three times, whilst the second prize is a gold medal, kindly promised by the Triumph Cycle Co., Ltd. Bronze medals will also be awarded to all those making non-stop runs.

Sheffield and Hallamshire M.C.C.

The final of the above club's annual reliability trial, which took place on the 4th inst. on a circular course of fifty miles in the Derbyshire district, proved most trying on account of the bad state of the roads, and again resulted in a tie between J. Haslam (2½ h.p. J.A.P.) and F. H. Dunstan (3½ h.p. Rex), Doncaster, for first place. The awards for this competition are as follows: 1st, the club's shield and gold medal; 2nd, prize value £2 2s.; 3rd, prize value £1 1s. J. A. Stacey (3½ h.p. Triumph) takes the third prize with a loss of one mark, and T. Durant (Chapelton) with a loss of two marks the club's silver medal as fourth prize. The ride between Haslam and Dunstan will take place in the course of a few days. The above riders have each covered a distance of 374 miles with an aggregate loss of less than five minutes.

Edinburgh M.C.C.

This club held a fifty miles open reliability trial and hill-climb on Saturday last over a circular course, starting at Fairmilehead, and finishing at the same place. The trial was conducted on a twenty miles per hour basis, two controls having been arranged at the foot of Flotterstone Hill, on which competitors were timed on both occasions, the first being a slow and the second a fast climb. Marks were given

according to the formula — $\frac{\text{slow}}{\text{fast}} \times 100$ for hill-climb and 500 for

reliability. The fastest climb was done by W. D. Cairns, and the slowest by Percy E. Tolfree. A gold medal, presented by the N.S.U. Co., was awarded to the winner. The results are:

Rider and machine.	Marks gained.
1. Percy E. Tolfree (5 h.p. Roc) ...	286
2. W. D. Cairns (6 h.p. J.A.P.) ...	284
3. Ralph H. Salvesen (3½ h.p. Triumph) ...	273
4. J. T. Borland (6 h.p. N.S.U.) ...	204

Six other competitors took part, but were not placed.

The above club will hold an open hill-climb on the 18th inst. Further particulars may be had from Mr. Percy E. Tolfree, trials secretary, 47, Falcon Avenue, Edinburgh.

Edinburgh M.C.C.
open reliability trial and hill-climb. The competitors. P. E. Tolfree, the winner, is at the extreme right. His mount is a 5 h.p. Roc-Peugeot.

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Controlling a Motor Bicycle from the Sidecar Seat.

[4253.]—Referring to letter 4176, August 4th, and photograph of Miss Lance driving a 6 h.p. N.S.U. from sidecar, may I ask—(1) How Miss Lance starts the engine? Does she always depend on some bystander to push the machine, or must a friend always accompany her? (2.) Does she find any excessive leverage on the length of handle-bar in taking sharp corners, and does she experience any trouble through stretching of Bowden wires? Incidentally I noticed two similarly steered machines driven by non-competitors on the last day of the A.C.U. Six Days' Trials which were very conspicuous on Birdlip. N.S.U.

Multi-point Ignition.

[4254.]—Referring to Mr. Ayton's article, "Speed and Power," published in *The Motor Cycle* on August 11th, when he refers to multi-point ignition, I presume he proposes to use a separate induction coil for each sparking plug, otherwise I fail to see how the mixture will be fired simultaneously at each point. The spark will always follow the path of least resistance, i.e., through the cleanest and most closely adjusted plug, and not half through each.

Perhaps Mr. Ayton will give further details for the benefit of readers of *The Motor Cycle*, including C. A. BARNES. [We have an article in the press on multi-point ignition, which will be published as soon as space permits.—Ed.]

The End-to-end Record.

[4255.]—I read Mr. Ivan B. Hart-Davies's account of experiences in his End-to-end record ride with much interest and congratulate him upon it, but should like a little of your space to make a few remarks thereon.

There are two points which I think call for comment, viz., the machine itself and the way in which the record was conducted to ensure success. As regards the machine, it seems that after all we are a long way from perfection if, in the opinion of the writer of the article (who is a most experienced and capable rider), there is a doubt about a machine which has travelled 5,000 miles being capable of breaking a 900 miles record.

Concerning the record itself, Mr. Hart-Davies's opening words express my meaning exactly. He says, "... the enormous amount of preparatory work," and further on, "I realised what heavy correspondence meant." We read that he beat the record by over seven hours. It follows that any further reduction in time must be mainly accomplished by even more perfect methods of organisation. It follows, sir, that only those who can acquire a new machine and have a long purse stand any chance in lowering the time.

Those who have these advantages can do much in the way of even better arrangements, such as a powerful car with expert mechanics on board to follow and tend the adventurer in all his troubles; small tent garages along the route with soup kitchen attached, and flagmen at dangerous corners, who could hand the rider a packet of sandwiches, and a special guide in busy towns to conduct him to his hotel, and whilst the aforesaid mechanics look after the machine, our hero is doing a Maskelyne and Cook trick by making "u" eggs disappear in "t" seconds.

Why not hire the Brooklands track and be done with it?

Motor cyclists would think much more of the performance of a man who started from one "End" all on his own and without preparations reached the other "End" (of course, in longer time), when they knew that his score was all off his

OWN BAT.

Fuel Consumption.

[4256.]—In recent numbers there has been some correspondence regarding fuel consumption. I wish to draw attention to a performance which is, if not a record of mileage, certainly a record of cheapness. The Middlesbrough and District M.C.C. held a fuel consumption trial on September 1st, over a fairly hilly circular course of 29½ miles, which had to be ridden in one and a half hours. The winner was Mr. Dale, who, riding a 1909 Triumph, only used 690 cubic centimetres of fuel, equivalent to 194 miles per gallon.

The fuel used was benzol (sp. gr. .882) which cost him 7d. per gallon in two gallon tins, and was part of his first tin, and the record I claim for him is the riding of 27 miles for one penny. The only alteration to the carburetter was the fitting of a smaller jet. I must confess I am interested in benzol manufacture, but in face of the above facts I am not at all ashamed to be so.

J. BELLERBY.

[4257.]—I am sure most readers will agree with me that F. C. James's letter, which appeared on September 1st, regarding Messrs. Brough and Reilly's performances in the Nottingham and District M.C.C. petrol consumption trial is written in a sarcastic vein, and is a direct challenge to both these sporting riders. Mr. Brough rode one of his own machines (a 5-6 h.p.) and Mr. Reilly a 3½ h.p. Triumph. The former's average over a circular course was 66 miles on 2 pints 15 ounces of petrol, which works out at 192 miles per gallon. Mr. Reilly's equally splendid performance worked out at 211 miles per gallon. Instead of Mr. James's letter congratulating them on their performances, this is an extract from it: "The other four 3½ h.p. machines in this particular trial averaged 127 miles per gallon—a most remarkable difference from No. 1 and No. 2."

On behalf of both riders I am prepared to deposit the sum of £10 with *The Motor Cycle* against Mr. James's £10 that both these riders shall under "official observation" beat their own performances over the same course. The loser's £10 to be given to some Nottingham charitable institution. Then, if Mr. James will accept my offer, he will soon learn how these performances are done.

F. PERCY JOHNSON.

Hill-climbing Competitions.

[4258.]—It appears to me that the hill-climb farce is just about played out. Clubs are on the look-out for fresh dodges to secure entries, the latest form of which is a gear gamble for all except a variably geared machine.

The great desire seems to be to prevent the best man and machine winning, and thus do away with any sport there ever was in it. In ninety-nine cases out of every hundred a hill-climb is only so in name, it is merely a question of speed; perhaps a better test would be to give the prizes to the man who could climb the hill on the highest gears; this, however, would still keep the variably geared type from having a "fair" chance, which would be most unfortunate.

Nobody seems to remember the days when T.T. models (the bane of every motor cyclist's existence) were unheard of. Who won then? Had the amateur any chance against Brice and the Brown for example? Everyone smelt his petrol, asked him what he had in the "little tank," if he used picric acid, etc., and yet when the machine was eventually dissected it proved to be "absolutely standard" in every detail. When all trade machines are picked from a large stock, then and only then will the amateur have a sporting chance against the trade.

F. C. MUSTARD.

Surface Evaporation.

[4259.]-Replying to letter No. 4250, Mr. Dickman puts his finger on the weakest spot when he mentions the nuisance of having continually to open the needle valve of a surface carburetter, but surely this could be overcome. If the same time and grey matter had been expended on the surface as on the spray type this objection would fall to the ground. I do not think much of the other two objections, which could both be overcome. I never experienced them. *Re* grade of spirit, 680 can still be had if it be asked for, and if motorists who have surface carburetters would ask their dealers to get them a can they would find that it is worth the extra 1d. or 2d. per gallon, even with a spray carburetter. *Re* the wires "festooning" the machine. Much improvement in this matter has been lately made, but my remarks still hold good regarding most machines. I am still of the opinion that the present-day carburetter is not worth the price asked for it.

CYGNUS.

Sunday Competitions.

[4260.]-Why does Mr. H. E. Vowler in letter No. 4234 uphold all competitions taking place on Sunday if, as he states, he is in favour of Saturday events? I am sure that the large majority of members of the Western District M.C. can, when necessary, turn out on Saturday afternoons for a competition, as is evidenced by the record turn-out for the annual hill-climb on Saturday, the 28th ult., when twenty-one members with their machines were present, and that during holiday time. I know of several members who are strongly opposed to Sunday competitions. Why not consider all the members, and have such events as hill-climbs, petrol consumption tests, and, say, the club's Coventry and back run, on a Saturday? To have many all-day Saturday competitions, I admit, is not convenient to the majority of the members, including myself, and I am quite in accord with some of the long reliability trials being held on Sunday. Under the circumstances which arose, however, I proposed that the club's Coventry and back and Salisbury and back events for the Triumph and G. B. Winter Cups respectively, be held on a Saturday.

I think Mr. Vowler should discriminate between "glory" and "enthusiasm." Does he accuse competitors in other events of being partial to "glory" if they wear armlets or carry numbers? Also does he think them unnecessary when a big entry is received and the timekeepers and checkers are unacquainted with the riders? Surely there should be some organisation in a competition if it is to be made interesting. Members do not take part with the sole object

of pot-hunting. Perhaps some disinterested reader will kindly state his views on the matter, and act as judge. I can only say that all I do is in the interests of the club, and with the object of getting large and sporting entries in the different club events. In conclusion, I hope the A.C.U. will not condemn the practice of holding some of the competitions on Sunday.

F. H. MULLETT.

Hon. Sec. Western District M.C., London. (Anti-Humbag No. 2.)

Motor Cycling in Ceylon.

[4261.]-Perhaps it might interest those motor cyclists who are always complaining about the price of petrol, delay in obtaining spare parts, etc., to hear how motor cyclists in Ceylon have to manage. There are two towns in the island which contain a motor shop worthy of the name, so that one has to carry a small workshop in one's toolbag unless one wishes to be stranded miles from any help. The price of petrol is from two rupees, or 2s. 8d. per gallon, up to about four rupees, or 5s. 4d. in the large outlying towns.

Our best engineering firm charges two rupees for recharging an accumulator. The price of a seven foot length of Whittle's belt (3ths) is only £1 18s., and other spare parts are not procurable in the island at all, so that some of the roadside repairs are rather quaint. Bungalow door-handle knobs for the jet chamber of a carburetter, nails for belt fasteners, bits of brass terminals fitted to retain loose gudgeon pins, telephone wire for brake cables have all been seen—even a length of "Whittle's" belt made by a Singha'sese carpenter to complete the unprocurable six inches. The roads are mostly sharp ascents and descents, with hairpin corners thrown in generously. Two-speed gears are a necessity on anything under 5 h.p., and a fan would be found extremely useful. The only consolation we have is that when we write to the home firms for parts, etc., we are always very well treated.

T. DENHAM-TILL.

The Six Days Trials.

[4262.]-To me the awards in the above trials are a grievous disappointment, so much so that I find myself writing my first letter to the press.

My case is, full marks under all heads except hill-climbing, for which very few got full marks, and I have been awarded such low marks for this that my gold medal has vanished.

My performances on the test hills, as recorded in *The Motor Cycle* of July 21st, are as follows: Dinas, dismounted; Festiniog, dismounted; Birdlip, excellent. There is no

Climbing Mont Ventoux in the recent hill-climbing competition. This mountain pass in the French Alps is even more severe than the forthcoming hill-climb of the A.C.U. from Ramsey to the foot of Snaefell, being 13½ miles long with gradients varying from 1 in 11 to 1 in 7½. Aurus, the rider in the illustration, completed the ascent in 42 min. 8 secs. on a French Excelsior motor bicycle.

question about it, I failed completely on Dinas, as did ninety per cent. of the riders, but on Festiniog, owing to the hill being obstructed by cattle (about which I complained to the judges at the time), I had to dismount and run beside my machine for about fifty yards of the hill—not altogether a failure, I think. A clean ascent of Birdlip completed my record. On this performance I have been awarded 25 out of a possible 75.

I observe other riders, whose records were certainly no better, obtaining much higher marks. I could quote several instances, but a couple will suffice. I take the records from *The Motor Cycle* of July 21st, and they are, I take it, official; and I trust I shall not be accused of ill-feeling in repeating them here.

Competitor No. 11 made the following performance: Dinas, dismounted; Festiniog, successful; Birdlip, dismounted. I believe I am correct in saying that this competitor dismounted and ran alongside his machine on Festiniog, yet his performance is "successful," while mine is "dismounted." Is this a better performance than mine? I do not think it is; yet he is awarded 50 marks and the all-coveted gold medal.

Competitor No. 19 failed on all test hills, and yet is awarded 45 marks, and this in spite of the fact that he had a change-speed gear.

I thought that it would have been only necessary to point out to the powers that be the inconsistency of these two awards with my own to have the matter immediately rectified, but no, they "see no reason for altering their decision."

I will conclude with what I consider another inconsistency. One competitor, whose tank developed bad leakage, had it removed from his machine and repaired by outside assistance at Shrewsbury headquarters, yet he obtained full marks for reliability and a gold medal.

J. O'M. DIXON.

Hotel Accommodation and Charges.

[4263.]—While cordially sympathising with all the sentiments contained in the leaderette on "Hotel Accommodation and Charges," I must protest against the statements that prices have automatically ascended with the "advent of the motor." My opinion is that "the advent of the motor" has had nothing to do with any increase in charges made at hotels, or any increase in charges made in any other trade. If there is any increase, it is chiefly due—

First, as far as hotels are concerned, to the increase in taxes on all liquors and tobaccos, hotel licences, and compensation charges.

Secondly, to the ever-increasing local rates and taxes, licensed premises being looked upon by the local assessment committees as a species of evergreen milch cow.

Thirdly, to the increase of wages, cost of provisions, etc.

Naturally enough, proprietors of hotels (being merely human), have found it impossible themselves to meet these various demands made upon them for all this increased expenditure, and have been unfortunately compelled to allow the British public to participate in the pleasure (?) of sharing the expenses with them.

The mass of officialdom (Governmental and local) which now appears to dominate the British Isles is being provided for by the increased taxation I refer to, and is an enormous expense per annum to the ratepayer. The public are at last awakening to that fact.

So when making use of hotel accommodation one must not forget the reasons for what may seem a heavy charge, and I trust in bringing the matter more clearly before your readers I have not bored them.

THE ROAMING MAGGOT.

Inconsistent Fines.

[4264.]—Thinking it may be of interest, and that it may also serve as a warning to readers, I beg to give you some particulars of the extraordinary disparity in penalties inflicted at Haywards Heath.

On May 9th last, a day which will long be remembered by some unfortunates, I rode to Brighton and back, and, thanks to the particularly malignant style of police trap worked in Hand Cross that day, the result was a conviction for a speed of seventeen miles per hour on the homeward journey, through the Hand Cross ten miles limit, the fine and costs totalling £3 10s. 7d. Now, last year, a friend of mine was convicted at Epsom of a speed of, I believe, thirty-two miles per hour, the fine and costs amounting to £1 6s. First offence in both cases.

What puzzles me is why it should be possible for me to be fined as above for a speed of seventeen miles per hour and my friend only 26s. for a speed of thirty-two miles per hour. There does not seem to be any rhyme or reason in it.

I should strongly advise readers who may be riding in East Sussex to take extraordinary care in ten mile limits, and should they be stopped by the police and asked to show their licences, let them bear in mind that full particulars of same, also number of machine, are noted, so that should the rider pass through a trap and exceed the ten or twenty mile limit, as the case may be, the police working the trap have simply to note the number, without showing themselves at all, and the only intimation the rider will have that he has exceeded the limit will be the receipt by him of a registered letter, notifying him that proceedings will be taken. I did not receive the summons until over two months after date of alleged offence.

The result of these methods is that motor cyclists, who may be riding alone, have not the slightest chance of defending themselves, however careful they may have been, and whatever evidence the police may advance in reference to their speed. The bench appears to scout speed indicator evidence in most cases.

TENMILIMIT.

The Use of the Carrier.

[4265.]—I noticed a few weeks back you wrote an article deprecating the growing use of the luggage carrier for the purpose of carrying a passenger. I think that this arrangement is less strain on both driver and passenger than having a sidecar attached. My remarks, of course, only refer to cases where rider and passenger are used to the carrier method of riding.

I can conceive no better way to carry two persons, for the speed and cost of upkeep are about the same as for a solo mount.

I enclose a photograph of my brother and self on a 6 h.p. twin Antoine-Chater-Lea, on which we travelled about 2,000 miles (on one belt). The machine was geared $3\frac{1}{2}$ to 1, and would take two to the top of Pebble Hill, Dorking.

The photograph is of interest, I think, as the dresses depicted were worn in the Church Pageant at Fulham, and the motor cycle was used to take us to the performance and back.

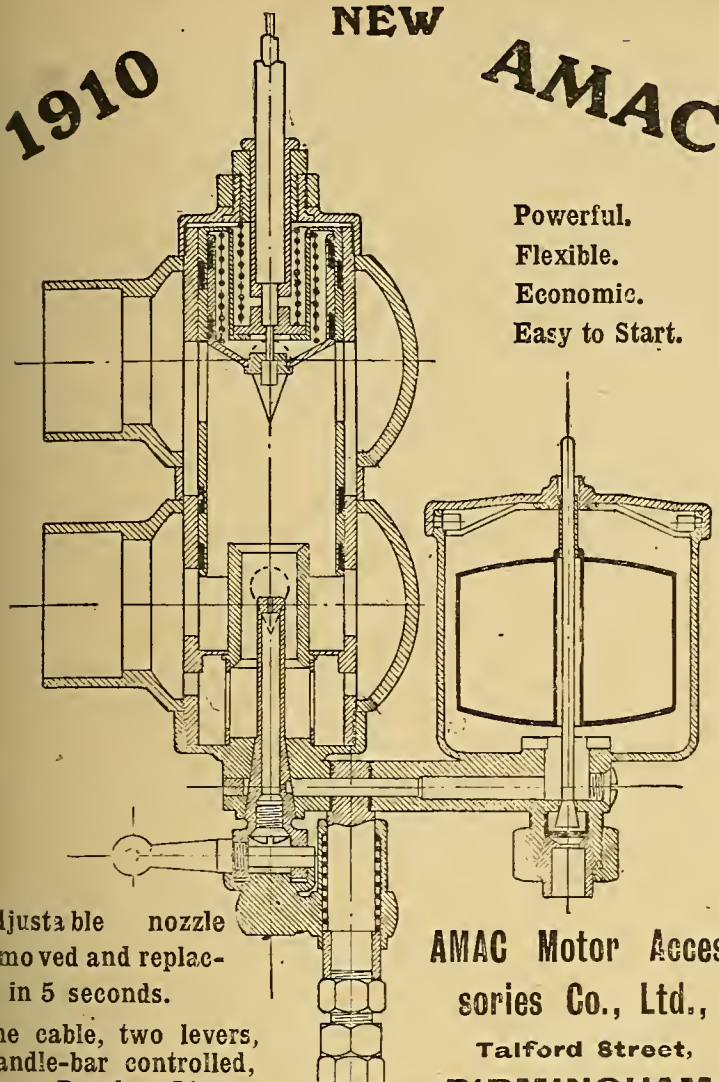

G. F. HUNTER.

EXPERIENCES WANTED.

"H.H." wishes to know if any rider of a chain-driven machine has been thrown or come to grief in any way through engine seizure.

"N. G. L." would be glad if any reader can suggest a method of improving the hill-climbing qualities of a 3 h.p. vertical twin Werner, geared $5\frac{1}{2}$ to 1.

ADDRESS—20 TUDOR STREET, LONDON, E.C.

An Inexpensive Form of Amusement.

It can now be truly said that the police do not do their duty in protecting the public from danger. We believe we are correct in saying that daylight burglaries are extraordinarily prevalent, as a casual glance at the newspapers will show. Accidents on the roads are far more frequent than they would be were the public properly safeguarded, and why? Simply because the police are hiding behind hedges which line the *straightest* and safest portions of our thoroughfares timing motorists who commit the purely technical offence of breaking the law. Very often this happens within a few yards of an appallingly dangerous cross-road, at which it is absolutely imperative that a constable should be on point duty. Those unfortunate motorists who are caught tripping are fined out of all proportion to the severity of the offence they commit, and anything between £5 and £20 may be expected from some of the Southern police courts. There are, however, cheaper forms of amusement than motor cycling. Cruelty to one's wife, brutality to dumb animals, and other wanton acts are held lightly by the gentlemen on the bench, and the newspapers are full of examples of the truth of this.

Only last week a striking incident was brought to our notice. Fines of 30s. each were imposed by the sitting magistrates on Saturday upon Herbert Remnant and Henry Townsend, farm labourers, for obstructing the highway at Ripley. Wire cable had been stretched across the road by the defendants at the height of three feet from the ground. To avoid an accident Charles Tice, a motor cyclist, had to fling himself from his

machine, which turned a somersault over the wire. Sergeant Arney said this sort of obstruction had occurred before at Ripley. The defendants were severely admonished and fined 30s.

It is past all comprehension that these men were fined at all. Imprisonment with hard labour is what anyone with any sense of justice would imagine would have been imposed, while to find a really adequate punishment is well nigh impossible. Had not Mr. Tice seen the wire the results of the accident cannot be contemplated, as it is well within the bounds of possibility that he would have been decapitated. A similar incident occurred in Sussex to a personal friend of the writer, but unfortunately too far from a village to allow of the police being warned in time. The severity of the offence and the smallness of the fine tell their own tale, and we may well ask where were the police?

The Autocar League.

A LARGE number of our readers have sent in their names and addresses for *The Autocar* referendum register, and the forms are still steadily coming in. A rather interesting point has been raised by several who are not only owners of motor cycles, but also of motor cars. These fortunate motorists want to know under which heading they will be classified. The reply is that they will be classified under both headings, so that they will be approached for their vote on every question brought up before the League, whether it interests the motor cyclist only, the motor car owner only, or both classes of motorists.

(Continued from page 695)

At 5.15 I arrived at a pretty little town, which I found to be Avallon on consulting the map. Seeing a motor cycle (the fifth only so far) outside a cycle shop, I enquired of the man in charge if he had an inner tube, as I had lost both air and confidence in mine. "What size?" That was a puzzler. I knew no more than the man in the moon the size in millimetres, so, taking him outside, he spent a quarter of an hour in admiring little things on my machine, including the silencer (which his machine lacked) and cut-out, etc. After a while he brought me a champion inner tube—a Michelin, red rubber, voiturette size, very thick—for which he charged 18 fcs., including fitting. While the tube was being fitted I proceeded to the "Hotel de la Poste et Voyageurs," where I was delighted to find the book-keeper spoke very good English.

My run of about 100 miles was quite satisfactory, considering the long time I was delayed by tyre troubles. The day had been glorious, the surface of the road even better, and the scenery had varied from very flat to mountainous. At the early part of the day I had noticed oxen drawing ploughs, and the number of magpies I saw was extraordinary.

Avallon to Autun.

Rising early next morning, I found it had been raining heavily. At breakfast I was surprised to have my coffee brought to me in a bowl with no handle at all and with a soup spoon to drink it with.

Calling at the cycle shop, I was still more surprised to see my muddy machine transformed into a new one, brightly polished and cleaned beautifully. The outer cover had also been patched inside and the old inner tube repaired. I now set off for Autun, but after a few miles my machine was as dirty as ever again, as the roads were in a wretched condition. The rain turned to sleet, and then at times to snow, the road getting worse and worse. On tackling a gradual slope my belt would race horribly,

and then on just giving a gentle kick on the ground the machine would glide away and get into a deep rut, which meant a sudden pull up, and often a wobble to the top, as it was impossible to restart by running alongside. Once at the top, the only method to start was to let the machine run on the stand for a while to dry the belt rim and belt. Naturally I did not make good progress, so on reaching Saulieu I rested. I had ridden fifteen miles, and it had taken me just 2h. 20m. Consulting my map, I decided to take train to Chalon, and at the hotel had my first taste of snails, which I had often seen but never tasted. They tasted something like butter does when it comes into contact with a steel knife (which is nasty). Next day (Thursday) the elements were almost as bad, and I was told that the snow was all over the country, and even at Rome and Nice. So I decided finally to take train to Marseilles. Entering the carriage, I tried in my poor French to ask a gentleman to remove his feet from the seat I wanted, and was very much surprised and pleased to hear him say

"Certainly, with pleasure. Good heavens! I had been trying my awful French on an Englishman. He proved a delightful travelling companion, and there was not a dull moment till we arrived at Marseilles about midnight, where we bade each other good-bye. He was going to San Remo."

130 Miles from Nice

Friday was glorious with blue sky and sunshine. I was only about 130 miles from Nice, so after a wait in Marseilles I set off for what I thought was a nice easy ride. I had extreme difficulty in finding the road out of the town. The road was vile and covered with two inches of grey mud, which quite filled all deep ruts and holes. Crawling along at walking pace, I had a beautiful skid, which made my number plate look remarkably silly. What a blessing handle-bar control! It was positively dangerous to take my hands off the

Route de Pontaubert, Avallon.

arrogate to the Riviera and Back by Motor Cycle.—

ars. Passing a workman on the road, he actually asked me the time, as though I could take my hands off the machine and start fiddling with my buttons, etc., to get at my watch! I gave him a look which could have frozen a polar bear and passed bumpily long. Misfiring here made itself apparent, so I cleaned the plug, and set off again, this time on the footpath. Soon, however, I reached delightful country, making for Aubagne. After Aubagne I lost my way. I had a beautiful French map of the

Riviera in my tool bag, but thought that I could easily find my way with my small scale map. I was always climbing higher and higher, and several times the houses below seemed like orange pips. Once a lovely view of Toulon with its harbour, forts, and battleships appeared. Absolutely lost, I always took the best road at any junction. Almost reaching Brignoles, I turned again, and soon began to climb in real earnest. Up and up, hardly ever easing, with hairpin corners, and with a sheer drop on the outside without wall or protection whatever. After two miles of this I halted and ate some large raisins and milk chocolate. Climbing again into the saddle, I was soon going slowly uphill and round the corners once more. This continued for some time, and then came the descent—a most welcome change. A clanking noise somewhere behind caused me to stop hurriedly; it was my pedalling chain, which had come off and got slightly twisted, so I put it in my pocket.

Looking at the petrol gauge, I was surprised to see only sufficient to last me for about twenty to twenty-five miles. I had absolutely no idea as to my whereabouts, except that I was not far from the sea, as that could be easily seen every now and again after a long climb. As for oil, I carried a gallon of Prince's A with me. It was getting dusk, so I quickened my pace, and soon got to Cuers, and, noticing a larger town, I decided to press forward, and there spend the night. A signpost for Hyères showed me my position, and, nearing that city, I passed numerous golfers (mostly English) and French blue-jackets. I was feeling quite at ease, gazing admiringly at a large hotel up on the mountain, when the next thing I knew was that the machine and I had started company, and I was rubbing my shoulder vigorously. Quite forgetting I was on a machine at all, I had ridden into the gutter.

After dinner I had a quiet smoke and thought over the events of the day, always to be remembered as the most exciting and eventful of my experience. The lonely feeling of seeing hardly a soul or hamlet of any description, the winding roads, some with their tremendous sheer drops down and no railing or guard, and, on top of it all, night coming on was most impressive. But, oh! the compensations. The first view one gets of the tideless Mediterranean; the gorgeous blue that makes the English sea appear a mere puddle. The tall and lovely trees and palms, and every now and again sweeping past a lovely hedge or clump of sweet smelling mimosa growing as wild

as the grass, and the medley of flowers and blossoms that make the air as sweet as a florist's shop. One must keep a sharp look-out on the road, as there is every possibility of being thrown into a clump of cactus plants or aloes of a remarkable growth and variety. Oranges and lemons were plentiful in the gardens, and if one felt thirsty one could stop at some cottage and buy a branch of lovely oranges or sometimes tangerines.

On Saturday I was on the move in good time, and after breakfast had the pedalling chain refitted. Starting at 10.15 (this time with my proper map), I

The Public Gardens, Nice.

made very good time to Cogolin, and, just missing St. Tropez, rode along the coast of the gulf of that name, soon finding myself at St. Maxime, with its pretty little luggers with dark brown patched sails. Striking inland, I steered for Frejus, and further inland I had a long steady pull of about six miles. I was again on a similar road to the one I was lost on the day before, twisting like a snake, a sheer drop down on the outside, and for ever climbing. Continually on the alert for vehicles (chiefly cars) on the corners got rather trying, so I halted for a cool smoke in the shade once or twice, a magnificent view always presenting itself. Consulting my map, I found the road from Frejus to the Col de l'Esterel (which I was now climbing) in a distance of about six miles rose from 21 metres above sea level to 676 metres.

- An Animated Picture.

Once at the top of the Col, there was a long serpentine road to descend (a free engine would be splendid here), which soon brought me to Cannes. Stopping for a few hours at Cannes, I had a look round the busy harbour, with its beautiful English and Continental yachts, with motor launches and dinghies passing to and fro.

Reluctantly leaving Cannes, I travelled along the coast road, passing a car which was neatly jammed between a lamp standard and a tramcar. All along the coast through Antibes and Cagnes a large number of powerful cars were met with, which frequently meant a friendly "dust up" at thirty-five or forty on a good stretch of road, consequently the journey to Nice seemed very short. Turning to the right brought me on to the world-renowned Promenade

Harrogate to the Riviera and Back by Motor Cycle.—

des Anglais, with its beautiful palms and gorgeous hotels. Turning to the left and through the Place Massena, I arrived at the Avenue de la Gare, and again to the left down the Rue d'Amérique, and I was at my hotel, the Hôtel St. Gotthard and Beau Séjour.

I then saw that my faithful mount was safely stowed away, and turned indoors.

I spent an enjoyable week at Nice, visiting Mentone, Cannes, etc., not forgetting Monaco and Monte Carlo, where after five hours' continuous playing I was only 40s. "out," and this amount a woman had coolly picked off a number on which I had successfully staked. Sometimes I had been £8 or £9 in pocket.

Nice is a charming place, and larger than I had imagined. I was sorry I could only spend a week there, instead of my anticipated fortnight, owing to the delay at Rouen.

I was astonished at the small number of motor cycles I had met with so far. I had only seen about a

ever-pleasing background of the Maritime Alps, with their snow-capped summits.

On the occasion of a run to Cannes one day I had the front hub again dismantled, greased, and replaced. This actually took the man two hours, so I was agreeably surprised at the low charge—about eighteen pence. I had the footrest removed and the rod which threads through it straightened.

It was now a difficult matter to successfully pump my box. I had started with three spare Bosch Triumph plugs in neat little boxes, but the latter had been rattled to almost pulp. The spare belt and fastener were in very good condition.

On Friday, March 19th, I awoke with the idea of starting on the return journey, but it was raining, and kept on raining intermittently until Saturday night. On Sunday morning I arose with the sun shining brightly into my bedroom and a beautiful blue sky overhead, so I packed and labelled my luggage, and wrote a note to Thos. Cook and Sons to call and forward it to Harrogate by Grande Vitesse.

I started on the homeward journey with a grand spurt down the Promenade des Anglais. There were few people astir, and the road was broad. My trusty Triumph was to carry me thousands of miles back to Harrogate, and with no speed limits existing, can anyone wonder that I "let her out"? On gaining the main road I turned for one farewell look at Nice, and then headed for Marseilles. Passing through Cannes again, keeping to the waterside, I rode heavily over a sunk sewer grating in the roadway, which twisted one of the brake blocks into the spokes, fortunately without damage.

Outside Cannes I noticed some large timbered buildings in course of construction, with some tremendous lettering, of which I caught sight of the word "Avi-

ateur," or something similar, so I took it to be an aeroplane garage in the making. This set my thoughts wandering. Should I one day put up here on my Triumph 3½ aeroplane? I soon awoke from my reverie, as I came to a fork in the road, and it was so sudden that I nearly climbed a bit of 1 in 1 (the signpost in the centre). The turning to the right was the one leading to the Col de l'Esterel. Continuing doubling back on the road I had just traversed, I overtook and passed a car after much fun at the corner. I had got a nice lead, when, attempting to pick up after slowing for one of the hairpin bends, the engine began to tackle the rise in the "hammer and tong" fashion. Hastily retarding the ignition a couple of notches did not stop it, so I ran alongside for a few yards to give it a chance to pick up, which it soon did. I immediately hopped into the saddle again, and breastst the top without any further falter.

(To be continued.)

In the Surrey M.C.C. twelve hours' reliability trial F. A. McNab, riding a Trump-J.A.P. with Helles dry battery ignition, won the gold medal.

Public Gardens at Mentone. The snow-capped mountains make a lovely background.

dozen, and practically all of them were being ridden in towns or on the outskirts. Motosacoches were most in evidence; also a four-cylinder F.N. and two or three extremely neat twin-cylinders with electroplated tanks. I should have enjoyed a hill-climb immensely to compare the machines' capabilities.

The early part of the morning after breakfast was often spent in the open air flower and fruit markets—quite a rendezvous. Here the country people bring their produce and flowers to sell. The ladies predominate in their extravagant "creations"—white kid boots with red heels and beehive hats. (N.B.—This is chiefly for the benefit of lady readers.) The colours were varied, some of which I am sure could never be copied. The ladies, of course, looked charming with their arms full of sweet-scented carnations or the splendid roses and narcissi, which were then in full bloom, or with a maid "at heel," carrying the vegetables and probably some "outlandish" fish.

There always seemed to be something going on—horse races, battles of flowers, carnivals, and motor meets, all made the more beautiful by the dazzling sunshine, and the lovely surroundings, along with the

OCCASIONAL COMMENTS

BY "IXION"

Sydney Jones

An Innovation.

I hear a prominent firm of motor cycle manufacturers are thinking of offering their 1910 customers a novel extra in the shape of machines fitted with car sized of tyres. They made an experimental machine fitted with very large rims and tyres, and found that this plan doubled the comfort and made punctures an extremely rare occurrence. There was, of course, a slight loss in speed and climbing powers, but the makers' opinion is that, from a steady-going rider's point of view, the disadvantages are more than compensated for by the advantages. Some of my readers will remember that A. G. Reynolds used to run a $\frac{3}{4}$ h.p. Bat in reliability trials, to which he had fitted a 3 in. car cover on the rear wheel, and that he was very enthusiastic about it, although he had so little horse-power, and the machine scaled nearly 200 lbs. fancy, if the firm adhere to their intention, they will receive a good number of orders for the big tyre model during 1910, even though the cost will naturally be high. The only objection seems to be the increased liability to side-slip with large-sized tyres.

Semi-racers for Road Work.

My experience of the ultra-light T.T. or special racing models is that they are usually most uncomfortable, because weight is usually pared off in just those points which make for comfort. I am at present riding one of these racing or semi-racing models, and though I do not appreciably exceed average physical dimensions, it is a misery to attempt a long ride upon it, for neither frame, saddle position, nor handle-bars are suited to my measurements. It has rigid front forks, short rigid handle-bars, and a road-racing saddle. Further, its engine has such an excessively high compression that it is neither flexible on hills or in traffic, nor yet easy to start; it has simply to be pushed down the road to obtain an initial explosion, and as it has no pedals and the piston gums up very easily, I cannot warm the engine by running it on the stand. I fancy a few sporting amateurs are inclined to buy similar models in the hope of securing superior pace and hill-climbing, without understanding that they must sacrifice in return a good deal of comfort and convenience. These racing models are all very well for their special purposes, but the average rider will continue to be better suited by the standard roadster models of most makes.

Hand-made Tyre Repairs.

I see a correspondent has fallen foul of Mr. Davies for recommending vulcanised tyre repairs, and if he meant that satisfactory hand repairs were not permanently satisfactory nowadays I think he is certainly wrong. But there is a very big "if" attached to this proposition, for they are abominably unsatisfactory unless they are thoroughly well done. A year or two back the best solution was not heatproof, and I don't care who applied a patch by hand, or what solution he used, it was certain to give trouble before very many miles had been covered. I think my personal record in the old days stood at about 500 miles before leaking.

Solution has improved out of all knowledge lately, both in rapidity and permanence of adhesion. I always use Patchquick patches, and I find these, when solutioned by hand with Patchquick solution, dry quickly, and stand up well. None the less I agree with Mr. Davies's advice in practice, especially for competition work. A hand-applied patch is all right if it is well and carefully affixed—the rock on which most failures split is applying the patch before the solution is dry enough, and I have often expressed my contempt of that popular word "tacky." But probably ninety out of every hundred amateurs are too careless or stupid to make safe hand repairs with certainty, and therefore a butt-ended tube is the immediate remedy for them, followed by a visit to a vulcaniser. Everyone ought to use detachable jointed tubes in competition, as changing is always quicker than patching. The very best patches are not perfect, because a sensible competition rider will see that he starts on new covers and tubes in any competition of length and importance. I may perhaps again remind riders that when tyre firms say the solution should be "tacky" before patches are applied, they mean that brightness should have disappeared and moisture should have evaporated.

The Tourist Trophy Race.

A reader has suggested to me that the huge entry secured for this year's Tourist Trophy Race has made the event much more open, because with so many competitors a good number of riders are sure to go round without any trouble, and so we may see a surprise—some comparatively unknown rider may cover the course without any loss of power or any stoppage and defeat all the cracks. This is exceedingly unlikely. To ride such a distance without trouble and without losing power is a task that demands expert tuning and expert nursing, and I fear on this account alone a vast proportion of the entry may already be written down as sportsmen who "also ran." But in previous events several riders have invariably finished without any trouble worth mentioning, and success really depends upon corner work. Beyond doubt it was Marshall's corner work which greatly helped to return him a winner last year. The course bristles with corners, and the man who can negotiate them without losing a possible second is the man who, other things being equal, will win. The only newcomer in whose favour I shall venture to make a reservation is Giuppone. None of our men can teach him anything at the racing game, whether in tuning or steering or nursing; and I have heard a very good account of the new 84 mm. x 86 mm. Peugeot engine. Of course some of our trade cracks are getting on in years, and as years increase a man necessarily parts with some of the reckless aplomb which leads him to take sporting risks fifty times in an afternoon. But Marshall, Collier, and Co. are as young-hearted as ever they were, and if some amateur in his teens does display a bit more daredevilry, I think superior experience will beat him. My tip is to keep an eye on the old stagers.

LETTERS to the EDITOR

The Editor does not hold himself responsible for the opinions of his correspondents.

All letters should be addressed to the Editor, "The Motor Cycle," 20, Tudor Street, E.C., and should be accompanied by the writer's full name and address.

Are Blinkers Necessary?

[4266.]—Will some of your readers who are horse owners and understand horses better than the writer, explain the reason for the use of blinkers? Is it not a fact that most horses would cease to shy as soon as they could see what was overtaking them on the road? Many drivers on being overtaken transmit their nervousness to the horse by suddenly tightening the reins, and then when the animal hears even a very quiet engine coming from behind he naturally becomes uneasy too. Could he but see the cause he might act differently than otherwise is the case. But let us have expert advice upon this subject.

HORSE SENSE.

Taxation by Horse-power.

[4267.]—I am glad to see that the question of the taxation of motor cycles by horse-power is again put forward. Now that cars are to be taxed according to power, because it is more equitable than the existing system, it is but fair to apply it to cycles as well. I am afraid it is not a matter that the majority of motor cyclists would be keen over, as medium-powered machines of $3\frac{1}{2}$ h.p. predominate. But I think all will agree that it is radically unfair for the $1\frac{1}{4}$ h.p. low-g geared lightweight to be taxed at the same rate as the most powerful machines on the road, and to graduate the tax is but a matter of simple justice. The trailer also is another subject of unjust taxation.

F. ROLPH.

Sunday Competitions.

[4268.]—In defence of Mr. Vowler's letter [4234], I would like to point out that this popular captain upholds Sunday competitions as he is anxious to see as large a gathering as possible, and in doing so I feel sure he is putting the interest of his club before his own personal feelings.

If the Western District hill-climb on Saturday, the 28th ult., was a record turn out, there would have been (given fine weather) an even greater record had it been held on the following day (Sunday), when those who could not attend on the Saturday would probably have been there.

Mr. Mullett appears to be writing on behalf of a favoured few, as it is not possible to get a day off for this event, and, indeed, impossible, in some cases, to arrive at Dashiwood Hill by four o'clock.

Mr. Vowler, in my opinion, was quite correct in his condemnation of armlets, for surely it is more harmful to race about on a week-day bearing armlets than quietly running without armlets on a Sunday. If Mr. Mullett favours competitions, as he says, in some cases, on a Sunday, why not always? There can be no conscientious objection about this.

Does Mr. Mullett really know of "several" members who object to Sunday competitions? If so, why not settle the matter as far as his club is concerned by having a ballot of every member's opinion?

EDWIN W. MACBAY.

[4269.]—Anent the controversy on Sunday competitions, it will perhaps be interesting to readers to know that the Harrogate and District M.C.C. has always endeavoured to run its competitions on week-days. However, some little time ago a certain section of the members stated to me that as Harrogate was a "season town" it was as much as their situations were worth to ask permission for Saturday afternoons off. Also it was very unfair to receive them as members and make no provision for them. The committee, therefore, instituted a few small evening competi-

tions, and these proved very successful, but it was found necessary to give these members something more than evening events, so a big all-day competition was organised for a Sunday.

This event proved, as far as enthusiasm and entries, the most successful the club has held, and what is more, every entrant was prepared to start directly his time was called. This naturally was highly pleasing to the committee, whose actions have been vindicated. This letter is written with the intention of showing that at least in this district such events are in request, and that the action of the A.C.U. in recommending that Sunday events be not held is not received with acclamation.

H. W. FORTUNE.

Hon. Sec. Harrogate and District M.C.C.

Lubrication.

[4270.]—The lubrication of motor cycle engines has been (and is) the subject of much controversy and discussion, and the ideas put forward from time to time to bring about a satisfactory solution have been numerous and varied, some showing cleverness and ingenuity.

If one could keep the oil in the crankcase at something like a steady level, I am convinced that it would tend more to the welfare of the engine and proper running than most riders are aware of. Such things as heavy deposits in cylinder and on piston caused by carbonised oil and dust from the road (which might be largely lessened by enclosing carburetter in a small tank or box, after the style of the old pattern Rex, 1906, I think) would be much less heard of.

Anything in the way of unnecessary complication, such as pumps and pipe systems, as described in *The Motor Cycle*, December 16th, 1908, which, in winter with temperature below 30° , would have a resistance to air-cooled oil something like the secondary winding of an induction coil, these things are not called for, and would be very undesirable.

Why not be able to actually see the oil level at any particular time. It has always seemed the simplest and most reliable way to me, to fit at base of crankcase, a sight glass, something like a petrol gauge. It could be fairly large in diameter, with cock top and bottom if required, so that a petrol squirt would remove any discolour immediately, and placed near a metal surface it would keep warm, and oil would not thicken in cold weather; it could also be protected from breakage.

The present system, hit or miss sort of thing, is very inadequate, and the above simple remedy, with oil level marked plainly on the gauge by the manufacturer in the first place, could be very easily kept constant (approximately) by the inexperienced rider. One would soon notice the number of miles that could be covered without replenishing, and an occasional glance would be sufficient to keep engine perfectly lubricated.

Oil a little under or over the mark would be of little consequence, as I would venture to say that any number of engines are running with the oil at anything from 1in. in depth (or less) to the other extreme. Personally, I took down a twin engine and found the oil was almost level with the main shaft.

As things are at present, even the most experienced rider is more or less in doubt about lubricating with road and gradient constantly changing. Perhaps we shall see something of the sort in the 1910 models.

FRANK JAMIESON.

Two-stroke Engines.

271.]—I see that the difficulty of crankcase explosions the Scott engine may be overcome to a certain extent, I should think the gauzes would need fairly frequent cleaning if the piston gets sufficient oil. My second argument may be time-worn, but I think it is perfectly obvious that the displaced type of motor will get more mixture in the working cylinder than the other types, and when the mixture is once in it is less likely to escape, thanks to the seal of the top of the cylinder head.

At high speeds the larger exhaust area and the position of the sparking plug in a pocket of mixture, free from exhaust gases, should show up the displaced motor to advantage. I do not see why my experience with the Scott motor should be of any particular interest to anyone, except those of the Scott Co. Anyhow, I have not had a chance to try yet, as there are none in our neighbourhood.

H. E. RENDALL.

The End-to-end Record.

272.]—Referring to letter No. 4255 by "Own Bat," appearing in last week's issue, I would like to mention that my End-to-end sidecar ride (since beaten by the Messrs. Bentley) the only assistance I received was from Mr. Alexander, of Edinburgh. He mended a puncture for me, very ably piloted me, mostly in the dark, over the tricky roads from Dunblane to Lanark. The feeding and sleeping arrangements which had been made by letter were of no use, owing to my not keeping to my schedule.

With regard to "Own Bat's" belittling of Mr. Hart Davies's record, I am sure that all motor cyclists who have experience of fast long-distance riding will agree with me that the keeping up of such an average speed over nine hundred miles of by no means good roads was a fine feat of endurance by both Mr. Hart Davies and his machine. There is to have been plenty of helpers in readiness, but I imagine they were not required to any extent, otherwise the ride would have been longer.

VIVIAN OLSSON.

S.S.—I hope next year someone will have a go at Mr. Hart Davies's record with a good twin-cylinder machine.

273.]—I read a letter in *The Motor Cycle* last week headed by "Own Bat," which I should like to answer. It refers to a performance which I, for one, consider one of the finest ever put up on a motor cycle. I refer to Mr. Hart Davies's End-to-end record.

Firstly, dealing with his remarks about the machine. For an engine of this sort you must leave nothing to chance, and it is only natural for the rider to choose as up-to-date a machine as possible; this, not because the old one will not do the job, but because the newer one naturally is more fitted for the task. Anybody with any knowledge of this record at all must appreciate this.

Then as regards the arrangements. This run is not a pleasure tour by any means. I look at it as one of the most arduous tests of man and machine possible. Let "Own Bat" do it himself before he sees fit to rather minimise the performance of one who has done so well as Mr. Hart Davies. He talks wildly and foolishly about a high-powered car to follow the record breaker, small tent garages, flagmen, and such further twaddle, all too utterly foolish, and displaying such an entire ignorance of this particular record as to be unworthy of comment.

If "Own Bat" would like to put up a record on his own without assistance, let him do so, but of what service is this as a test of the motor cycle he rides I am at a loss to know.

Firstly, the road is exceedingly difficult to find, and he would lose hours in this way. Also I should like to ask him how he would obtain petrol and oil at night? It is not a one man job at all.

Also why should the rider not have friends to follow him if they are good enough sportsmen to do so? And there are men who will do this, and a better sporting action than this I find it hard to imagine.

As regards hiring Brooklands, this is not possible. Had it been possible I should have done so before now myself. No, honour to whom honour is due, and as one who has been over this course more than once I should like to again congratulate Mr. Hart Davies on a really excellent performance.

I neither appreciate a man who has not the courage to sign his own name to a letter of this sort, nor do I like a man to endeavour to belittle another man's genuine effort.

ARTHUR W. BENTLEY.

Hill Climbing.

[4274.]—In answer to Mr. Nanson's letter [No. 4245], on June 16th last, Mr. Oakey and myself climbed to the top of the pass mentioned, both mounted on 5 h.p. Vincennes with two-speed gears.

By the way, it would be interesting to know if Mr. Nanson got up without a stop.

Can anyone claim an ascent of the Honister Pass from the Buttermere side without pushing? Mr. Oakey and I got over about three weeks ago with full kit of luggage and overalls, etc., but had to run by the machines in places. This is far the worst hill I have ever tackled.

I have climbed nearly all the bad hills in the country, and among the worst in order of merit I should place: Honister Pass, Lynwood (between Beggar's Roost and Lynton, starting from Cottage Inn), Amulree (Kenmore side), Cock Bridge to Tomintoul, Porlock, Beggar's Roost, Bealloch-nam-bo-Diabaig, Lynton (summit), Lynmouth, Dinas Mawddwy, Bala, etc.

Any stout non-skid tyre is quite satisfactory on rough mountain roads.

M. E. D. DICKSON.

Views of Bealloch-nam-bo-Diabaig (the Pass of the Cattle), Scotland, referred to in letter No. 4245 on the 8th inst., and also letter No. 4274 which appears above.

Surface Evaporation.

[4275.]—Replying to letters 4250 and 4259, it may interest readers to know that I have been driving a 1904 $3\frac{1}{2}$ h.p. Rex with surface carburetter for over four years, and had at first the same trouble with the regulation of the supply of petrol. This I overcame perfectly by fitting a small indicating finger on the top of the needle valve, which enabled me to regulate the supply of petrol in a similar manner to that employed in gas-lamp generators. I always drive with the extra air opening on the top of the tank quite closed, and if a rich mixture is required for a hill a quarter turn of the needle valve is enough. I never have an excess of petrol in the carburetter, but am always getting fresh, which is instantly vaporised as it drips, and is carried into the cylinder. I can also use a heavier spirit with this method, whereas with my previous $2\frac{3}{4}$ h.p. Rex nothing would do but Carless petrol.

I quite agree with "Cygnus" that the present day carburetter is not worth the price asked for it, and often wish my $4\frac{1}{2}$ h.p. tricar was fitted with a

SURFACE CARBURETTER.

Motor Cycle Design.

[4276.]—"Nearly every other motor bicycle one meets is a copy of the Triumph." So runs letter No. 4243. Upon what grounds does the writer base this assertion? Admitting that one or two firms with a limited output have more or less copied the Triumph, I should like to know in what respects the following makes resemble it. Take the Rex with its sensible riding position, Roc with live axle, etc., Bat, V.S., F.N., Zenith, N.S.U., Indian, Minerva, P. and M., Humber, and the lightweights. Is there any resemblance? Not a bit. But stay, they are all fitted with wheels, also an engine; most machines run better with this last minor fitting. But did the Triumph Co. bring out these items? I don't wish to attempt to belittle an excellent machine, but I certainly think it absurd to say that "nearly every other motor bicycle one meets is a copy of the Triumph." With regard to magneto position, I have yet to learn that the Triumph Co. were responsible for fitting the first magneto in front of the crankcase. A friend of mine had a $2\frac{3}{4}$ h.p. De Dion so fitted in 1904, and I personally rode a De Dion tricycle with magneto fitted in almost the same position in 1903. In the latter case the magneto was low tension with reciprocating armature. But then the real pioneers of magneto ignition were most certainly the Singer Co. and Wait, of Leicester, makers of the Clyde machines. These firms were regularly fitting magneto ignition before the Triumph Co. made motor bicycles.

If the usual magneto position worries "J.N. 375," why does he use a machine so fitted? There are heaps to choose from with the magneto in a different position. Douglas, P. and M., Chater Lea, Roc, N.S.U. (twins), Bat, etc. Where does the copying come in? No, no, "J.N. 375," don't look upon all manufacturers as sleepy idiots who require a Blériot to wake them, but give them credit for the improvements they have introduced, and which are not copied.

HUBERT J. M. HUGHES.

Continental Touring.

[4277.]—With regard to the article in *The Motor Cycle* on Continental touring, my experiences in taking a motor bicycle to France this summer might perhaps interest some intending tourists. In view of a trip abroad I became a member of the Motor Union and also the Touring Club de France (7s. 6d.). From enquiries I went prepared to expend anything between £2 and £3 on landing in France for licence to drive, registration, number plates, etc. My actual bicycle expenses were: Ireland to Southampton (bicycle in crate), 11s.; Southampton to Le Havre, 5s. At Le Havre I met with every consideration and civility. While I was getting my heavy luggage through the *douane* and taking it to the station to forward by rail the foreman of the company (a most obliging official) landed my bicycle, uncased it, and stored the crate; charge, *nil*. I then presented my Customs ticket (obtained through the M.U. without charge or deposit as the motor was only a bicycle), and obtained a *permis de circulation*, price 6d. I was then interviewed by a motor vehicle official, who examined my Customs ticket and *permis de circulation*, and asked me how long I would be in France. Conversation with him elicited the fact that payments for licence to drive, etc.,

though legally chargeable, were not enforced (as a matter of courtesy, I presume) on visitors for short periods. Wh I mentioned six weeks as my probable stay he seemed doubtful as to whether the licence duties should be enforced or not, but I looked so guileless that I was permitted to proceed without further payments *et me voilà en route*.

On one occasion only during my tour was I asked for a licence. I had left my bicycle in the open garage at M. St. Michel for about three hours while I was seeing sights, and on my coming out again I noticed two gentlemen taking a great interest in my motor. When I went forward they accosted me rather sharply, asking where my *plaque* (licence plate) was. I explained as best I could showing my *permis*, Customs ticket, and English licence and they became quite affable, and even servile.

During my stay in France I motored at least 2,000 miles chiefly in the districts west of the Seine and north of the Loire. If I can give further information to any motor cyclist I shall be happy to do so.

IA 50

SUMMARY OF CORRESPONDENCE.

Will the enquirer who wrote to Bowden's Patents Synchro-Cate, Ltd., from "Gordon Street, Workington," forward name and full address to the above firm at 29, Baldwins Gardens, Gray's Inn Road, E.C., to enable his enquiry to be answered? His letter of the 14th inst. was unsigned, and gave no number in Gordon Street.

Mr. J. Robertson-Brown gives the following brief particulars of a tour which he thinks is likely to interest readers. "The machine was a 5-6 h.p. four-cylinder F.N., with pedals, fitted with a rigid sidecar. Two 12 st. passenger seats, spare two gallon can of petrol, one quart lubricating oil, and a respectable sized bag of luggage was the load carried. The first day we rode from London to Bettws-y-Coed—100 miles. We made this a centre for a week, camping out, and from there visited all the surrounding country as far as Llandudno, Bangor, Carnarvon, Festiniog, Beddgelert, Penrhyn, etc. We then shifted our quarters to Llandudno for a few days, and while there climbed the Great Orme Head by the road that passes St. Tudno's Church. Leaving Llandudno we made for Harlech, Barmouth, Dolgelly, Aberdovey, Machynlleth, Aberystwyth, and Rhayader, where our tour ended. We covered about 700 miles, averaging seventy miles per gallon of petrol, and used one and a quarter quarts of Price's water-cooled lubricating oil. The plugs were not even cleaned, and the consistent running of the engine with such a load was most astonishing. We had no difficulty whatever in surmounting every hill."

Mr. W. Edwards writes: "My brother and I recently returned from a 1,000 miles tour through England and Wales, and as our combined troubles throughout the tour were two punctures and two sooted plugs, we should like to express our approval of the excellence of our machine. Both mounts were 1909 L.M.C.'s fitted with Lloyd's Automatic pulleys, automatically reducing from $4\frac{1}{2}$ to 1 to $6\frac{1}{2}$ t.p.h. and the manner in which they adapted themselves to various gradients was most gratifying. My brother's weight with luggage was 11 sts. 12 lbs. He averaged 110 m.p.h. to the gallon, and, with the exception of shortening the chain twice, did not make a single adjustment of any description. I weighed with luggage 14 sts. 10 lbs., and averaged 100 m.p.h. to the gallon."

EXPERIENCES WANTED.

"Nemo" would be glad if the owner of the machine bearing the registration P1BK would say whether it has a speed gear only, a free engine, or both.

"T. E. W." would like readers' experiences with motor driven tandem tricycles with double driving rear axles and single steering wheels.

[A number of interesting letters are held over, and will be published as space permits.—Ed.]

NOTICE.

The Editor disclaims all legal responsibility in any way for loss of copy in the form of manuscript, drawings, or photographs submitted to him. Rejected manuscript, drawings, and photographs will only be returned provided a stamped addressed envelope is enclosed for the purpose.

IMPROVEMENTS IN DETAIL.

By "ROTATOR."

ONE hears so many expressions of good opinion of the leading makes of motor cycles that I fancy fair criticism of one of our best makes will be an interesting change, and very likely helpful to designers of motor bicycles in general. I had better preface my remarks by stating that I rode motor cycles before the 1903 Motor came into force, and have covered 11,000 or 12,000 miles on Triumph 1906-7-8-9 patterns. I may add that I was induced to buy the first of this make by the most comfortable riding position enabled by the footrests, long handle-bars, and very low frame. My 1909 model has undoubtedly given me the most satisfaction—probably because of the extra pleasure derived from the use of the hub plate clutch—but in a few details the machine fails to come up to my ideal. Whilst realising that riders' personal tastes differ considerably, I know I shall not be alone in wishing that the Triumph for 1910 possesses some or some of the following alterations in detail.

Some Suggested Improvements.

The oil pump, it must be admitted, is not fitted in the most convenient position. A novice told me the other day that he had to slow down to a crawl before he dared attempt to inject a charge of oil owing to the position of the pump. Now, so far as I can see, there is nothing to prevent either the pump being placed nearer to the saddle so that a vertical push is obtained, or, better still, to incline the pump towards the rider. An oil gauge would also be a blessing. Several times this year I have stopped for petrol, and the garage has not possessed a funnel with a small enough spout to fit the tank filler. There is plenty of room for a filler twice the size. Further, the flanged edge of the cap cannot be tightly gripped with a gloved hand or on a very cold day. Why not shape the top of the cap like the stoppers fitted to chemists' glass phials?

The handle-bars are very graceful, but they would be improved, in my opinion, if the handles were tapered still more at the ends, so that the rider's hands assumed a more natural position. And I fancy that larger grips would often be appreciated, especially if made of soft comfortable material. One's coat sleeves have a nasty habit of catching in the inverted lever mechanism. I have made several nasty swerves owing to this. The brake and exhaust levers themselves might also be rounded off more to ease the strain on the fingers.

Handle-bar Lever for the Magneto.

I am one of those who would like to see the magneto advance controlled by a lever on the handle-bars, say the left one. It is usually most necessary to slightly retard the ignition at an awkward moment on a rough road or corner, when one cannot very well remove a hand from the bars.

It would also be a splendid idea to fit the rear brake independent of the footrest. Three times in three

years I have side-slipped, and in each case I have bent the footrest and put the best brake out of action.

The adjustable pulley is a most useful article, but it would be so much handier if it could be altered without opening the toolbag and disfiguring the pulley spanner by hammering the end of it with the wrench.

The stand fastening is also open to improvement. Unless a spanner be used, the stand frequently shakes loose on a bumpy road. I much prefer a kick operated stand, like the Lake and Elliot; it saves soiling the fingers or gloves on a muddy day.

To open the cut-out, one has to soil and spoil after a time a pair of brown boots. A double lever, one to open and one to close the cut-out, is wanted.

Adjustable Main Air Intake.

With reference to the carburetter, I think it is generally known that a carburetter when adjusted perfectly for slow speeds is imperfect for high speeds, and *vice versa*. I have fitted an adjustable main air intake—somewhat crude—to my machine, with excellent results. I can now get the utmost out of my engine, and easy starting is not impaired when the air levers are closed. A similar arrangement carried out in the Triumph Co.'s excellent style to replace the air

An adjustable main air inlet, recommended by "Rotator," which would improve many existing carburettors. For easy starting and slow running, the air supply is partly cut off, thus enriching the quality of the mixture drawn into the cylinder.

adapter at the base of the carburetter would, I am sure, be welcomed, and render starting much easier.

Since all motor cycles have to be fitted with a horn and lamp, why should not these be included in the standard specification—of course at an extra charge? Some riders want something different, but it would at any rate put an end to the numerous complaints regarding the attachment of these articles and lamp brackets breaking, as a proper lug could be permanently attached to the bar on which to fix the horn in a rigid manner, and lamp and generator would be also attached to brackets purposely made to suit them.

As regards finish, black enamel and plated parts look very nice on a show stand, but after five miles on the road there is little of the glitter to be seen. French grey enamel is better, but is said to chip badly.

Belt fasteners have caused me some delay and worry, and there is room for improvement, principally in material and size of wearing surface.
